The effluent treatment plant of BASF works in Ludwigshafen, the largest chemical complex in Europe, is described. Wastes from the chemical complex are segregated into contaminated and uncontaminated types and are handled by two separate drainage systems. Uncontaminated wastes which are used for cooling purposes are discharged into a system which also receiv sewage from the city of Ludwigshafen. Co taminated wastes are discharged separately f treatment at the effluent purification plant. Af neutrilazation and passage through a coarse b screen, contaminated wastes are then passed the treatment plant where they flow through fi screens and roughing tanks. The raw wastes a equally distributed in activated sludge units, a the mixed liquor flows through a secondary se mentation basin from which purified water discharged into the Rhine River. Settled sludge partly recycled into the activated sludge units. I cess sludge and primaary sludge from the rough tanks pass to a thickener unit and are dewatered filter presses after mixing with ash, lime, and i salts. The filter cake is burned in several fluid b incinerators. (Kreager-FIRL)

PURIFICATION OF INDUSTRIAL WAS WATER - HAVING HIGH CONCENTRATI OF DISSOLVED SOLIDS BY TREATME WITH STRONG ACIDS OR BASES TO GI FERTILISERS AND FEED ADDITIVES.
French Patent FR 2286-121. Issued May 28, 19
Derwent French Patents Abstracts, Vol. X, N 28, p D3, 1976.

Descriptors: *Patents, *Food processing indust *Waste water treatment, *Reclamati *Byproducts, Fertilizers, Additives, Feeds, Fil tion, Evaporation, Separation techniqu *Industrial wastes, Dissolved solids, Water pur cation.

A patent for an industrial waste water purificat method which yields fertilizers and feed additi as byproducts is described. The method invol the following steps: the automatic separation water with a high dissolved solids concentrat from water with a low dissolved solids concen tion; mixing the high dissolved solids fraction w strong acids or bases to obtain stable salts; fil tion to remove insoluble and precipitated s stances; concentration of the solution by evapo tion up to the saturation point with respect to least soluble salts; crystallization of the conc trated solution in one or more stages; and conse tive separation of mineral salts from the mot liquor which is rich in organic substances. T separated salts can be used as fertilizer or feed ditive, and the residual water may also be used feed additive. The process is particularly suit for waste water from food processing operati such as sugar refineries, distilleries, the ferme tion industry, and the starch and dextrin indus (Kreager-FIRL)

EFFECTS OF SELECTED IONS ON T REMOVAL OF CHROME (III) HYDROXIDE,
Notre Dame Univ., South Bend, Ind. Dept. Civil Engineering.
M. J. Thomas, and T. L. Theis.
Journal Water Pollution Control Federation, V 48, No. 8, p 2032-2045, August, 1976. 14 fig, 6 t 14 ref.

Descriptors: *Chromium, *Waste water tr ment, *Industrial wastes, *Chemical precipitati *Ions, Chemical wastes, Metals, Carbona Phosphates, Chemical reactions, Colloids, Coa lation.
Identifiers: Metal finishing industry.

The effects of anionic and metal ion impurities the removal of chromium wastes generated du metal finishing rinse operations are reviewed. removal technique considered involves the red tion of chromate-bearing waste to chromium (under acid conditions (pH of 3) followed precipitation of chromium (III) hydroxide un slightly alkaline conditions. The coagulation settling of colloidal chromium hydroxide shown to be a function of both the quantity

of impurity ions present. Troublesome ions as carbonates and phosphates which have origin in rinse baths should be kept egated from wastes containing chromium (VI). cond option to eliminate difficulties caused by onates and phosphates is to modify the treat- scheme for the combined waste. An example e use of lime instead of caustic soda for ralizing the waste after chemical reduction of mium (VI) to chromium (III) has occurred. use of lime will cause the precipitation and val of most of the carbonate and phosphate ies from solution while also providing doubly ged counterions to aid in the coagulation of negatively charged chromium hydroxide col- that exists at pH values of above 8. (Kreager-L.)

MOVAL AND RECOVERY OF CYANIDE ZINC FROM ELECTROPLATING STES BY SOLVENT EXTRACTION,
Ridge National Lab., Tenn.
. Moore, and W. S. Groenier.
ng and Surface Finishing, Vol. 63, No. 8, p 26- August, 1976. 1 fig, 4 tab, 12 ref.

criptors: *Zinc, *Metals, *Industrial wastes, clamation, *Waste water treatment, Chemical es, Water reuse, Solvent extractions, Separa- techniques, Feasibility studies.
tifiers: *Cyanides, *Electroplating industry es.

feasibility of using solvent extraction for the val and recovery of cyanide and zinc from roplating wastes was investigated in a labora- scale continuous mixer-settler. Quaternary es were used to extract the zinc and cyanide es, and regeneration of the amine solent for cle was achieved by stripping it with dilute m hydroxide. Free cyanide and zinc cyanide successfully removed, concentrated, and vered during 60 runs in which 100 liters of ac- rinse solutions from an industrial electroplater treated. The process yielded two useful ucts, the decontaminated water and a sodium oxide concentrate containing the recovered nicals. The extraction and stripping of cyanide zinc throughout the process were essentially titative. Amine losses to the aqueous raffinate aged in the 30-50 ppm range. (Kreager-FIRL)
-00747

BRILLIANT NON-CYANIDE ZINC PLATING.
Industrial Finishing, Vol. 52, No. 6, p 48-51, June, 1976.

Descriptors: *Industrial wastes, *Waste water treatment, *Zinc, *Electrochemistry, Nickel, Cadmium, Chemical precipitation, Settling basins, Sludge disposal, Dewatering, Waste treatment, Effluents, Chemical wastes.
Identifiers: Metal plating industry, Metal finishing industry, Zinc plating, Cyanide, Electro-plating.

A non-cyanide zinc plating system that minimizes cyanide contamination of plant effluent is described. The system employs Kenlevel II chloride zinc solution at a current density of 200 amperes/barrel and an operating voltage of 6.5-7 volts. Asarco high purity zinc ball anodes are used along with a Koroseal-lined dip tank. Rinse waters from zinc plating as well as nickel plating and black oxide treatment operations are routed to treatment, precipitation, and settling tanks. Chromate rinse and cadmium rinse containing any cyanide are treated at the point of use prior to being routed to precipitation and/or treatment reservoirs. Caustic soda which is added to the various rinse waters in the reservoirs precipitates the metals which are allowed to settle. Clear liquid which is adjusted to the proper pH is drawn off and allowed to seep into porous subsoil around the plant. Sludge is periodically drawn off or pumped out and dried for subsequent land fill disposal. (Kreager-FIRL)
W77-00748

FIGHT AGAINST POLLUTION AND NUISANCES IN THE FRENCH STEEL INDUSTRY (LUTTE CONTRE LES POLLUTIONS ET NUISANCES DANS LA SIDERURGIE FRANCAISE),
R. Chantereau, P. Geny, and J. Raguin.
La Technique Moderne, No. 6, p 70-75, June, 1976. 9 fig, 2 tab.

Descriptors: *Steel, *Industrial wastes, *Air pollution, *Waste water treatment, *Ammonia, Biological treatment, Acidic water, Neutralization, Flotation.
Identifiers: Hot dissociation.

Pollution control in the steel industries is reviewed. The ammonia contained in coke gases is absorbed by water which is then stripped, producing fumes which are incinerated and waste waters which are biologically treated. The agglomeration of minerals is a source of dust and smoke emissions; the dust is usually removed by electrofilters and has to remain under 150 mg/cu m at STP. Oxygen steel plants produce refinery gases (CO) and diffuse smoke. The gases can be collected without or with CO combustion; in the latter case, excess gas burners are used along with venturi scrubbers. Smoke is treated through a mixer unit which collects the smoke and removes dust and through a second unit which consists of three converters. Cold rolling waste waters go through a number of processes consisting of the neutralization of acid waters with calcium carbonate, the hot dissociation of oil-water emulsions, the de-oiling of the rolling waters by electroflotation, the continuous cold treatment of emulsions, and the treatment of electrolytic degreasing waters by air flotation. Waters thus treated will have a pH of 7.5, a total iron content under one mg/liter, and a sludge water content of 70%. (Takacs-FIRL)
W77-00749

PROCESS FOR GASIFYING CARBONACEOUS SOLIDS AND REMOVING TOXIC CONSTITUENTS FROM AQUEOUS EFFLUENTS,
Exxon Research and Engineering Co., Linden, N. J. (Assignee).
M. L. Gorbaty.
United States Patent 3,975,168. Issued August 17, 1976. Official Gazette of the United States Patent Office, Vol. 949, No. 3, p 1081-1082, August, 1976. 1 fig.

Descriptors: *Chemical wastes, *Sulfides, *Waste water treatment, *Air pollution, *Trace elements, Effluents, Industrial wastes, Hydrogen sulfide, Chemical precipitation, Separation techniques.
Identifiers: Gasification, Scrubber effluents.

A patent for a process which allows for the gasification of carbonaceous solids and the removal of toxic constituents from off-gas scrubber effluents is described. Carbonaceous feed material is reacted with steam to produce a raw product gas containing methane, hydrogen, carbon monoxide, carbon dioxide, and hydrogen sulfide. Heat is generated by the combustion of the carbonaceous solids to produce a raw flue gas having a lower hydrogen sulfide content than the raw product gas. This flue gas also contains toxic trace elements. The raw product gas is scrubbed with water to produce a product gas scrubber effluent containing hydrogen sulfide, and the raw flue gas is scrubbed with water to produce a flue gas scrubber effluent containing toxic trace elements. The two scrubber effluents are combined, and gases from the combined effluent are then stripped to produce an aqueous stripper effluent. Thereafter, precipitated trace element sulfides are removed from the aqueous stripper effluent. (Kreager-FIRL)

WET AIR OXIDATION OF ALKALINE PULP LIQUORS.
Australian Patent 472,619. Issued May 27, 1976. Australian Official Journal of Patents, Trade Marks, and Designs, Vol. 46, No. 18, p 1763, May 27, 1976.

Descriptors: *Patents, *Pulp and paper industry, *Waste water treatment, *Chemical wastes, *Oxidation, *Evaporation, Incineration, Industrial wastes.

A patent for a process to treat alkaline pulping black liquor is described. The process involves subjecting the raw black liquor to wet air oxidation at a pressure between 500 and 1000 pounds/sq in and a temperature of between 220 and 280C. After substantial evaporation occurs, the residue is incinerated in a furnace. (Kreager-FIRL)
W77-00753

DETOXIFICATION OF BLEACHED KRAFT MILL EFFLUENTS,
British Columbia Research Council, Vancouver.
J. C. Mueller, and C. C. Walden.
Journal Water Pollution Control Federation, Vol. 48, No. 3, p 502-510, March, 1976. 3 fig, 4 tab, 15 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Activated sludge, *Lagoons, *Aeration, Biological treatment, Foam separation, Toxicity, Biochemical oxygen demand, Chemical wastes, Industrial wastes.
Identifiers: *Detoxification.

Removals of 5-day biochemical oxygen demand and toxicity from bleached kraft mill effluents were assessed for a 5-day retention aerated lagoon, a 24-hour extended activated sludge system, and a 6-hour retention activated sludge system operating under conventional and modified conditions. The 5-day lagoon, operating on direct feed but subject to upset during periods of nutrient deficiency and by remixing of scum, detoxified only 52% of the samples. In contrast, the same

lagoon operated with surge equalization under quiescent conditions and without remixing of scum detoxified 98% of the samples. The 24-hour system with poor mixing detoxified 85% of the samples and achieved a 94% detoxification success rate when operated with good mixing. The 6-hour system with direct feed and good mixing detoxified 68% of the samples. A modified 6-hour system in which pretreatment by foam fractionation preceded 6-hour retention activated sludge treatment detoxified 96% of the samples. All three systems operating under convention conditions aperiodically failed to detoxify effluents. (Kreager-FIRL)

ZINC REMOVAL FROM VISCOSE PLANT EFFLUENT - BY EXTRACTION WITH ALKYL PHOSPHORIC ACID INTO AN ORGANIC SOLVENT AND RE-EXTRACTION DECOMPOSITION THEREFROM.
South African Patent ZA 7406-710. Issued April 22, 1976. Derwent French Patents Abstracts, Vol. X, No. 26, p D1, May, 1976. 3 fig.

Descriptors: *Patents, *Solvent extractions, *Textiles, *Zinc, *Waste water treatment, Solubility, Metals, Chemical reactions, Industrial wastes, Chemical wastes, Liquid wastes.
Identifiers: Textile industry.

A patent for a process to remove zinc from aqueous solutions of viscose plant effluent is described. The process comprises a liquid-liquid extraction with a solution of a dialkyl phosphoric acid in an organic solvent such that the zinc and alkyl phosphoric acid form a compound which is more soluble in the organic solvent than in the aqueous solution. The organic solvent is then separated from the aqueous solution. The separated organic solvent is separated with an aqueous solution to split the compound formed and to redissolve the zinc in the aqueous solution The zinc-free organic solvent is then separated from the aqueous solution and returned to the extraction step. The dialkyl phosphoric acid is characterized by having alkyl constituents containing at least four carbons in straight branched cyclic alkyl, or phenyl configurations. (Kreager-FIRL)
W77-00756

ELIMINATION OF ZN FROM WASTEWATER OF RAYON PLANTS BY PRECIPITATION,
Akzo Research Labs., Arnhem (Netherlands).
H. C. DeJong.
Resource Recovery and Conservation, Vol. 1, No. 4, p 369-379, June, 1976. 4 fig, 4 tab, 10 ref.

Descriptors: *Textiles, *Zinc, *Reclamation, *Waste water treatment, *Chemical precipitation, Recycling, Industrial wastes, Chemical, Chemical wastes, Metals, Solubility, Treatment facilities.
Identifiers: Textile industry, Rayon plants.

The removal and recovery of zinc from rayon plant waste water by precipitation is discussed along with a commercial zinc removal process known as the fluidized layer system. The fluidized layer process is based on a two-step neutralization of the influent. In the first neutralization stage, impurities such as ferric ion, cellulose, sulfur, and zinc sulfide are removed. A precipitate of zinc hydroxide formed in the second step. The process allows for the reuse of zinc after formed zinc hydroxide sludge has been dissolved in sulfuric acid. Bench-scale application of the fluidized layer system to waste water from rayon plants yielded an effluent with a zinc content of 0.22 ppm. A theoretical discussion of factors affecting the solubility of zinc hydroxide is presented along with methods for the characterization of zinc hydroxide precipitate. (Kreager-FIRL)
W77-00757

LARGE-SCALE EFFLUENT TREATMENT IN THE DYESTUFFS INDUSTRY.
International Dyer and Textile Printer, Vol. 156, No. 2, p 79, 81, July 9, 1976.

Descriptors: *Textiles, *Dyes, *Waste water treatment, *Treatment facilities, *Municipal wastes, Flocculation, Sedimentation, Biological treatment, Aeration, Sludge, Incineration, Waste disposal, Industrial wastes, Dewatering.
Identifiers: Dyestuff industry, Textile industry.

A large-scale effluent treatment plant in the dyestuffs industry which also treats 14,000 cu m/day of municipal sewage from nearby communities is described. The treatment plant covers an area of about 30,000 sq m and comprises about 30 treatment stations grouped to form the following major plant sections: chemical/physical section, clarifying section, biological section, and sludge and waste incineration section. The effluent from the chemical works is pretreated in the chemical/physical section at a feed rate of up to 800 cu m/hour. This section comprises an acidic flocculation and flotation stage, an alkaline flocculation and sedimentation stage, and a buffer basin. Municipal sewage is pretreated in a mechanical clarifier and runs parallel to the industrial effluent treatment line. Biological sewage treatment occurs in four treatment lines for aeration, deaeration, and secondary settling. A total of 635 cu m of sludge settle out daily in the acidic and alkaline flocculation stage and in the biological treatment stage. This sludge is dewatered in a number of thickeners and is then burned in a fluidized bed furnace. (Kreager-FIRL)
W77-00758

RECLAIMING WATER,
V. Montgomery.
Modern Textiles, Vol. 57, No. 8, p 36, 38, August, 1976.

Descriptors: *Textiles, *Dyes, *Reclamation, *Water reuse, *Waste water treatment, *Reclaimed water, Automation, Recycling, Treatment facilities, Equipment, Economics, Filtration.
Identifiers: Textile industry.

A water reclamation system at a textile dyeing plant is described. The system recycles 1,900,000 gallons of water/day and can hold 80,000 gallons at one time. The entire operation is monitored from a master control panel that automatically sets the chlorine level for the water and determines correct pH. Two huge 20,000-gallon fiberglass tanks are fed by four smaller fiberglass working tanks of 10,000 gallons each where chemical treatment and filtration are used to clean the water. Dye is removed, and phosphate is retained. The entire treatment process requires only four minutes, with another five to six minutes being required to feed the four tanks. Due to the short time needed for dye water to pass through the system, the cleansed water re-enters the dyehouse at relatively high temperatures, thereby reducing fuel consumption and costs for heating dye water by as much as 45%. (Kreager-FIRL)

INFLUENCE OF SIZING AGENTS AND PRINTING THICKENERS ON BIO-CHEMICAL WATER PURIFICATION,
Scholten-Honig Research B. V., Foxhol (Netherlands).
P. J. A. Beersma.
Water and Waste Treatment, Vol. 19, No. 6, p 36, June, 1976. 1 tab.

Descriptors: *Textiles, *Waste water treatment, *Chemical oxygen demand, *Biochemical oxygen demand, *Water purification, Binders, Polymers, Oxidation, Oxygen demand, Alcohols, Organic compounds, Chemical wastes, Colloids, *Biological treatment.
Identifiers: Sodium alginate, Starch derivativ Polyvinyl alcohols, Polyacrylates, Synth polymers, Thickeners, Textile industry.

The influence of colloidal substances which used in textile sizing (binding agents) and prin (thickeners) on the purification of effluent wat discussed. For the total oxidation (chemical ygen demand) of most starch derivatives, 110 milligrams of oxygen per 100 milligrams of product are required. The same applied to der tives of cellulose and guar gum. Synth products such as polyvinyl alcohol and polya lates require more oxygen for complete oxidat Sodium alginate compounds require relatively tle oxygen in comparison with the above c pounds. A comparison of the 5-day biochem oxygen demand values of various binding ag and thickener reveals that natural products wi degrade easily have much higher biochemical ygen demand values than synthetic polym (Kreager-FIRL)

REMOVING IRON FROM ACID WA LIQUIDS BY OXIDATION - AT CONTRÒL PH BY ADDITION OF BASE, GIVING EAS SEPARATED PRECIPITATION FOR LAR SCALE USE.
French Patent FR 2284-568. Issued May 14, 1 Derwent French Patents Abstracts, Vol. X, 26, p D2, April 9, 1976.

Descriptors: *Patents, *Iron compounds, *W water treatment, *Oxidation, *Chemical preci tion, Industrial wastes, Chemical wastes, Fi tion, Separation techniques, Acids, Ions, Oxid
Identifiers: Metals industries.

A patent for a method to remove iron from wastes generated during the etching of iron p cles or during the production of titanium dioxi described. The process involves the oxidatio acid waste liquids containing ferrous ions at a perature of 50-75C and a pH between 3.5-5. the addition of a base which results in the fo tion of a precipitate containing multicrystal glomerated particles of an iron compound. base claimed in the present patent is amm although other bases such as hydroxides of p sium, magnesium, or calcium may be used. precipitate is filtered off, giving a clear, al neutral liquid. The large iron-containing part are removed as iron oxide and iron peroxide b tration; the ferromagnetic iron oxide may Alt tively be separated in a magnetic field. The o tion is caused by blowing air into the waste li and ammonia is added to the air stream. The o tion is continued until the pH suddenly ris about 7. (Kreager-FIRL)

LUENT TREATMENT IN THE PAINT AND FACE COATING MANUFACTURING IN- TRY,
. Hemming.
t Manufacture, Vol. 46, No. 6, p 8-13, 29, , 1976. 2 fig, 1 tab.

criptors: *Chemical industry, *Waste water tment, *Paint, *Industrial wastes, *Sludge tment, Effluents, Biochemical oxygen de- d, Chemical oxygen demand, Suspended ds, Metals, Flocculation, Biological treatment, ration, Sedimentation, Coagulation, Flotation, mical wastes.
ntifiers: Paint manufacturing industry.

uents generated by paint manufacturing plants described along with methods for their treat- t. Typical values for effluent chemical oxygen and, biochemical oxygen demand, suspended ds, chromium, zinc, lead, antimony, tin, and are: 6200, 4200, 700-2000, 0.2, 6.0, 3.0, 5.0, , and 20 milligrams/liter, respectively. Treat- t options for purifying paint manufacturer ef- nts include: coagulation, flocculation, sedi- ntation, flotation, microflotation, and biologi- treatment (activated sludge or biological filtra-). The use of chemical flocculation and sedi- ntation or flotation can be expected to remove ut 80% of the suspended solids and about 50% he biochemical oxygen demand and chemical gen demand in mixed effluent from paint nufacturing operations. Additional purification uired for discharge to a water course is accom- hed by biological treatment. The resulting ge generated from effluent treatment generally a solids content in the range of 1-3% and can oncentrated up to about 25% (by weight) using hanical dewatering. (Kreager-FIRL)
7-00764

APORATION AND THERMAL OXIDATION LIQUID EFFLUENTS - BY BURNING WITH AME IN COMBUSTION CHAMBER.
gian Patent BE-838-608. Issued June 16, 1976. went Belgian Patents Abstracts, Vol. X, No. p D2, 1976.

criptors: *Patents, *Chemical wastes, *Waste er treatment, *Evaporation, *Incineration, In- trial wastes, *Oxidation, Liquid wastes, Solid tes, Equipment, Design criteria, Chemical in- try, Toxicity.
ntifiers: Thermal oxidation.

patent for a process designed to achieve poration and thermal oxidation of liquid ef- nts containing toxic products generated from industrial operations such as refineries, paper mills, color manufacturers, and petrochemical plants is described. The apparatus used for continuous evaporation and thermal oxidation of the wastes includes a central conduit for conveying effluent which is sprayed at an outlet to produce a liquid jet, an annular conduit surrounding the central conduit which is fed with a fuel gas and is pierced with orifices which open into a pipe surrounding the annular conduit, and a turbine which causes combustion air to rotate by its own kinetic energy before reaching the fuel. The resulting flame has a divergent shape and is spatially distinct from the liquid jet. The flame vaporizes the effluent by convection currents in the combustion chamber. In addition to treating the products in the liquid effluent, the apparatus can also be used to burn solid wastes as a result of their admixture with the fuel. A stable flame can be obtained by making use of the blown secondary air employed for spraying the effluent. (Kreager-FIRL)
W77-00765

OPTIMIZE THE EFFLUENT SYSTEM - PART 5: MULTI-MEDIA FILTERS,
J. F. Grutsch, and R. C. Mallatt.
Hydrocarbon Processing, Vol. 55, No. 7, p 113-118, July, 1976. 8 fig, 5 tab, 2 ref.

Descriptors: *Filtration, *Waste water treatment, *Oil industry, *Effluents, *Separation techniques, Suspended solids, Activated sludge, Lagoons, Aeration, Biological treatment, Industrial wastes, *Filters.
Identifiers: Mulit-media filters.

The use of multi-media filtration for the treatment of refinery effluents is discussed. Topics discussed include: filtration mechanisms, chemical pretreatment for direct filtration, refinery make-up water clarification, filtration of API separator effluents, filtration of aerated lagoon effluents, filter unloading, and filter failure. Direct filtration for phase separation is cited as a key element in end-of-the-pipe treatment sequences for the removal of suspended matter to levels that permit optimization of activated sludge processes. Determining the proper chemical pretreatment to destabilize suspended matter prior to filration is the key to sucess in applying filtration. Direct filtration is also applicable to intake water, effluents from secondary treatment, and essentially all phase separation problems if destabilization chemistry is addressed. (Kreager-FIRL)

REMOVAL OF ORGANICS FROM WATER,
Permutit-Boby, Ltd., London (England).
M. C. Rowe.
Effluent and Water Treatment Journal, Vol. 6, No. 47, p. 519-522, 1975. 5 fig., 2 tab., 4 ref.

Descriptors: *Waste water treatment, *Water softening, *Organic wastes, *Resins, *Ion exchange, Cellulose, Fouling, Humic acids, Adsorption, Byproducts, Organic acids, Phenols, Industrial water, *Industrial wastes.
Identifiers: Viscose resins, Polystyrene resins, Acrylic resins.

A weak base macroporous viscose (regenerated cellulose) exchanger which was hydrophilic and reduced 'fouling' caused by irreversible adsorption of humic acids was compared with a strong base polystyrene macroporous resin and a weak base acrylic 'gel' resin. Its adsorption and desorption efficiencies were higher. Viscose resins could, by running ahead of the polystyrene resins, reduce the organic load induced during high runoff. Use of the two resins in series would save space and labor, could be automated, would not be susceptible to high organic breakthrough, and would reduce humic acids more. With acidic brewery condensates, high molecular weight acids slipped the polystyrene resin. Acrylic resins adsorbed low molecular weight organic acids better. Viscose resins adsorbed slippage from the polystyrene resin; they had a high capacity for proteins and high molecular weight organic acids and gave better desorption of large organic acids. Polystyrene resin capacity was lowered with increasing molecular weights; some neutral phenolic materials were adsorbed. This method permits removal of organic material from water and process streams over the whole molecular weight range. The regenerant can be evaporated and the ammonium salts of the organic acids crystallised and recovered. The ammonia driven off in the evaporation can be trapped and reused, and the ammonium acid salts used as an animal feed supplement. (Buchanan-Davidson--Wisconsin)

DETOXIFYING INDUSTRIAL WASTEWATERS.
Environmental Science and Technology, Vol 10, No 2, p 127-29, Feb 1976. 3 p, 1 map, 3 photo, 1 chart.

Descriptors: *Toxins, *Water pollution control, *Treatment facilities, *Industrial wastes, *Water pollution treatment, Water pollution sources, Water policy, Monitoring, Water resources, Treatment, Pollutants, Waste treatment, Water treatment, Sewage treatment, Chemical wastes, Oil wastes, Sludge, *Waste water treatment.

Systematic toxic waste disposal has become an increasing problem in recent years. Because of treatment complexity, troublesome sequestering, and cost factors, many industrialized firms are not in a position to build detoxification plants that meet anti-pollution requirements. Regional treatment centers offer a solution to this problem. These centers accept almost all inorganic materials and solutions. Such materials are delivered in plastic cylinders to the center where they are transferred to large storage tanks. The storage tanks are divided into eleven sections which are classified as to the

materials received. The solutions then undergo several chemical processes that are described in detail. Some of the processes include reprecipitation, decontamination of cyanide, and ion-exchanger regeneration. The treatment charges for this process, which are fixed by the center's board of directors, are considerably cheaper than individual treatment. If these centers are fully utilized, water pollution by toxic solutions can be considerably abated since companies will no longer have to dump the solutions into streams. (Hoffman-Florida)

METHOD FOR IMPROVING SEWAGE SLUDGE INCINERATION,
Nalco Chemical Co. Oak Brook, Ill. (Assignee).
G. Flynn.
United States Patent 3,974,783. Issued August 17, 1976. Official Gazette of the United States Patent Office, Vol. 949, No. 3, p 951, August 1976.

Descriptors: *Patents, *Sewage sludge, *Sludge treatment, *Sludge disposal, *Incineration, Temperature, Magnesium compounds, Metals, Waste treatment, Solid wastes, Carbon, Burning.
Identifiers: Combustion.

A patent for a method that improves sewage sludge incineration by lowering the ignition temperature of carbon is described. The method involves burning the sewage sludge in the presence of between 50-8000 ppm by weight (based on dry sewage sludge) of an additive consisting of a metal compound and a magnesium compound. The metal compound may contain copper, cobalt, manganese, iron, or calcium. The magnesium compound may be either magnesium oxide or any magnesium compound which decomposes to magnesium oxide under combustion conditions. The weight ratio of the magnesium compound (expressed as Mg) to the metal compound (expressed as said metal) is between the range of 5:1 to 35:1. (Kreager-FIRL)

American City and County, Vol. 91, No. 8, p 47-48, August, 1976. 2 fig, 2 tab.

Descriptors: *Zeolites, *Water softening, *Waste disposal, *Waste treatment, *Brine disposal, Chlorides, Sodium compounds, Calcium compounds, Magnesium compounds, Reverse osmosis, Electrodialysis, Lagoons, Recycling, Water treatment, Costs.
Identifiers: Holding tanks.

Problems associated with the disposal of brine wastes generated by zeolite softening units are discussed. These wastes contain chloride ions (principally from sodium, calcium, and magnesium compounds) proportional to the amount of salt used in the regeneration of the zeolite. Disposal techniques usually focus on keeping these brines out of local streams since high concentrations of the chlorides formed during the regeneration process can be harmful to both aquatic life and livestock. If limiting values for the constitutents of zeolite wastes are known for a given stream, the flow necessary to dilute the wastes may be estimated. Volume reduction of the brine waste by utilizing the regenerative capacity of the brine is a good treatment method. By returning brine normally exhausted during the regeneration cycle to the brine storage tank, the discharge and treatment of the waste can be reduced by about two-thirds. Estimated waste disposal costs are tabulated for the following treatment methods discussed: reverse osmosis, electrodialysis, lagoon (annual discharge), holding tank with steady discharge, and holding tank (20 years). (Kreager-FIRL)

IRRIGATION OF CORN WITH SIMULATED MUNICIPAL SEWAGE EFFLUENT,
Michigan State Univ., East Lansing. Agricultural Experiment Station; and Michigan State Univ., East Lansing. Dept. of Crop and Soil Sciences.
D. L. Karlen, M. L. Vitosh, and R. J. Kunze.
Journal of Environmental Quality, Vol. 5, No. 3, p 269-273, July-September, 1976. 4 fig, 6 tab, 25 ref.

Descriptors: *Irrigation effects, *Municipal wastes, *Sewage disposal, *Nutrient removal, Nitrogen, Potassium, Sodium, Plant growth, *Corn(Field), Laom, Denitrification.

A field study designed to evaluate the effects of applying 25, 50, 100, and 200 cm of simulated municipal sewage effluent to corn grown on a tile-drained loam soil was conducted. The results indicated that if effluents which are low in potassium and high in sodium are to be renovated through land disposal supplemental potassium must be applied. The experiment also demonstrated that the annual loading rate on a tile-drained Conover loam should not exceed 100 cm of supplemental effluent if efficient utilization of the applied nutrients through plant uptake is to be achieved. Nitrogen recovery through plant uptake at the 25-, 50-, and 100-centimeter loading rates exceeded 40% of the nitrogen applied through effluent and starter fertilizer when the corn was harvested as silage. Nitrogen uptake in the grain at these loading rates exceeded 50% in 1973 but was much lower the following year. The distribution of NO3 and C1 and the C1/NO3 ratios suggested that much of the unrecovered nitrogen was denitrified. (Kreager-FIRL)

DEMONSTRATION OF A PLANNING PERSPECTIVE FOR WASTE WATER SLUDGE DISPOSITION.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 684, $7.50 in paper copy, $3.00 in microfiche. Report EPA-440M-76-001-b (WPD 01-76-01), January 1976. 183 p, 12 fig, 24 tab, 60 ref, 4 append.

Descriptors: *Waste water treatment, Analytic techniques, *Treatment facilities, *Plannin *Sludge disposal, Sludge, Waste dispos Management, Project planning, Cost analys Reclamation, Industrial wastes, Sewage tre ment, Water pollution, Ohio, Kentucky, Indiana

Waste water treatment and sludge dispo methods of plants in the Ohio-Kentucky-India region were investigated to test an application o methodology previously developed by the E vironmental Protection Agency. Fifteen of t area's 158 waste water treatment facilities and proposed facilities were selected for evaluatio The sample plants were surveyed by on-site i spection and analysis of available recor Background information is included such as the gion's economic and institutional characteristi and environmental setting, current waste wa treatment and sludge management practices, a applicable air and water quality and land use re lations. In application of the methodology, vario sludge management alternatives are analyzed terms of technical feasibility, costs, environmen impacts, sociopolitical implications, and other fa tors. Each facility is analyzed based on volumes sludge generated, characteristics of the sludg and current sludge disposal methods. Suitab sludge disposal alternatives are identified. Exce for the various disposal methods currently bei practiced by each waste water treatment pla wet land spreading appears to be the most unive sally applicable sludge disposal method. Four ternatives are presented for regional slud management systems, all involving four centr ized processing facilities with sludge dewateri capabilities. The dewatered sludge would disposed of in a regional landfill site, a reclamati site, suitable agricultural land, or by incinerati (Snyder-FIRL)

SCALE INHIBITION AND COMPOUNDS THEREFORE,
Nalco Chemical Co., Oak Brook, Ill. (Assignee).
J. R. Stanford, and P. G. Vogelsang, Jr.
U.S. Patent No. 3,965,003, 6 p, 8 ref; Official Gazette of the United States Patent Office, Vol 947, No 4 p 1724, June 22, 1976.

Descriptors: *Patents, *Water treatment, *Water softening, *Scaling, Hardness(Water), Chemical reactions, Water quality.
Identifiers: *Scale inhibitors, Phosphated oxypropylated amines.

It has been found that phosphated oxypropylated amines and/or phosphated oxypropylated hydroxy hydrocarbons, with or without neutralization, are effective scale inhibitors in inhibiting scale deposits from water containing scaleforming chemicals. The phosphated oxypropylated amine is introduced into hard water or brine which is usually contacted with metal or other solid surfaces while maintaining a hardness-ion-precipitation-preventing quantity in the order of 0.5 per 100 parts per million (ppm) of the active effective compound. PORTABLE WATER STERILIZATION DEVICE,
G. C. Dawson.
U. S. Patent No 3,965,008, 4 p, 5 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 947, No 4, p 1726, June 22, 1976.

Descriptors: *Patents, *Water treatment, *Water purification, *Water pollution treatment, Water pollution control, Water quality control, *Potable water, Bacteria, Electrodes, Electrolysis, Equipment.
Identifiers: Portable equipment.

A light weight portable device is used for sterilizing water containing harmful bacteria. The components of the device are removably connected to one another, and may be separated and stored in a compact arrangement if the device is not in use. The device is particularly adapted for supplying potable water from contaminated water in areas that have been subjected to a disaster such as a flood, earthquake or the like. The components of the device may be readily assembled into a usable unit by persons having little or no mechanical skill. The invention includes a tank in which contaminated water may be placed. Two laterally spaced, oppositely disposed, elongate electrodes are situated within an L-shaped tubular member. Two terminals are provided for supplying alternating electric power to the electrodes at a voltage potential sufficient to kill harmful bacteria in the contaminated water which flows by gravity between the electrodes. WASTEWATER RECYCLING ALONG TRANSPORTATION CORRIDORS,
Black, Crow and Eidsness, Inc., Clearwater, Fla.
L. A. Dove, and E. G. Rivers.
Transportation Research Record, No. 571, p 28-35, 1976. 6 ref.

Descriptors: *Waste water, *Water reuse, *Irrigation, *Transportation, *Institutional constraints, Reclaimed water, *Recycling, Florida, Cities, Reclamation, Nutrients, Feasibility studies, Florida.
Identifiers: Saint Petersburg(Fla).

The feasibility and desirability of irrigating green spaces along transportation corridors with highly treated waste water is discussed, with particular reference to a zero-discharge, total-recycling waste water system for the city of Saint Petersburg, Florida. The system produces a virus-free waste water effluent that retains the valuable nutrients essential to plant growth. It is demonstrated that policies of the American Association of State Highway and Transportation Officials and Federal and state governments have established at least a permissive attitude on the use of treated waste water for irrigation of transportation corridors. Research on utility-accommodation policies and practices as well as on the feasibility and health effects of waste water recycling along transportation corridors is recommended. Applications involving the reuse of treated waste water for land disposal throughout the United States are reviewed. (Kreager-FIRL)

Descriptors: *Waste water treatment, *Pollutant identification, *Analytical techniques, *Treatment facilities, *Sewage treatment, Incineration, Air pollution, Control, Inspection, Performance, Testing procedures, On-site tests, *Water quality standards.
Identifiers: Air pollution control.

Guidelines are presented for field inspections to determine whether new or modified sewage sludge incinerators comply with New Source Performance Standards (NSPS). These are particulate emission and opacity standards for incinerators burning sludge produced by municipal waste water treatment facilities. Key parameters identified during the performance test are used for comparison during subsequent inspections to determine the facility's compliance status. Descriptions of the sewage sludge incineration process, atmospheric emissions from these processes, and emission control methods are included. A detailed discussion of the inspection methods and types of records to be kept is also provided. A survey of emission limitations in state implementation plans is presented. (Snyder-FIRL)

COMPUTERIZED CITY-WIDE CONTROL OF URBAN STORMWATER,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
N. S. Grigg, J. W. Labadie, G. R. Trimble, and D. A. Wismer.
American Society of Civil Engineers, New York, NY, Urban Water Resources Research Program, Technical Memorandum No. 29, February 1976. 81 p, 22 fig, 5 tab, 52 ref, append. NSF GI38465.

Descriptors: *Control systems, *Sewers, *Storm runoff, *Overflow, *Optimization, *Information retrieval, Water pollution control, Storage, Detention, Reservoir operation, Mathematical models, *Dynamic programming, Systems analysis, Automatic control, Combined sewers.
Identifiers: *Combined sewer systems, Mathematical programming, Optimal control theory, Control logic, Urban water systems.

Automatic computer control has been applied in industry for over 15 years. The soft and hard technology developed thereby can be applied to control city-wide stormwater and combined sewer systems. Drainage patterns of urban catchments fit into a framework that suggests hierarchical control by minicomputers. Considerable opportunities for productivity improvement exist using such an approach to automatic control. At the same time, the hurdles to successful automation projects should not be minimized. There are at least five separate categories of models needed and the effectiveness of automation strategies is closely connected to the success of the mathematical models adopted. Total automatic control should be implemented in an evolutionary procedure reaching the closed-loop phase only after carefully completing the data logging, remote supervisory and computer assisted control phases. The decomposition approach to control fits naturally with the morphology of urban catchments and the emergence of hierarchical computer control systems. This approach seems most promising for overcoming the complexities to city-wide systems. (McPherson-ASCE)

Descriptors: Water quality, Lakes, *Pumps, *Pumping, *Stratification, Epilimnion, Thermocline, Hypolimnion, *Destratification, *Mississippi, Reservoir releases, Reservoir operation.
Identifiers: *Lake Okatibbee(Miss), *Garton pump.

In temperate climates, many lakes stratify during the summer. A typical stratified lake will have a warm oxygen-rich epilimnion, a thermocline, and a colder oxygen depleted hypolimnion. High levels of iron, manganese, hydrogen sulfide, and ammonia and dissolved hydrocarbons may occur in the hypolimnion. Many efforts have been made to destratify lakes, primarily by air bubbling. These methods require large energy inputs. A low-energy destratifier using a 1.83 m propeller to pump water downward from the surface has been used successfully to destratify a 100 acre lake (35 feet deep) for three years. This project involved using the pump on Lake Okatibbee, a broad, shallow lake of approximately 1537 ha (3800 Ac) with a maximum depth of slightly over ten meters. Its volume is approximately 5.2 x 10 m (42000 ac. ft.) At Lake Okatibbee the pump was placed over the intake structure, which contains the deepest waters of the lake, in an effort to enhance the quality of water relased from a low level outlet. From the data obtained it is evident that the Garton Pump can indeed induce water from the epilimnion to flow downward into the intake structure so that the water actually released has the characteristics of the near surface water of the lake. PROCESS FOR REMOVING DISPERS MATTER FROM WATER,
Exxon Research and Engineering., Co., Lind N. J. (Assignee).
C. A. Irani, and D. J. McHugh.
U.S. Patent No. 3,965,001, 5 p, 4 tab, 6 ref; O cial Gazette of the United States Patent Off Vol 947, No 4, p 1723, June 22, 1976.

Descriptors: *Patents, *Oil pollution, *Oily wa *Water pollution control, Water quality cont *Separation techniques, Sea water, Adsorpti Hydrogen ion concentration, Salinity.
Identifiers: Ballast water, Flocculated salts.

A process for separating dispersed matter fr water consists of adding a flocculated salt selec from the group consisting of aluminum, iron Group IIA of the Periodic Table of Elements additional oil. The salts adsorb the disper matter and oil and are separated from the wate precipitating the salts by adjusting the pH. process is useful for the removal of petrolium from sea water such as ballast water. preferred flocculated salts are magnesium hyd ide, strontium carbonate, and calcium carbon The flocculated salt is stirred with the water ph for about 1 to 30 minutes to substantially adso the dispersed matter. When agitation is disc tinued the oil, along with the flocculated salt dispersed matter will rise to the surface wher can be collected. Oxides or hydroxides of calc are preferred basic materials for adjusting the of sea water. Furthermore, the calcium salts th selves will not generally detract from the qualit the water which is returned to the sea after tr ment. (Sinha-OEIS)

MODEL OF RECYCLING AND POLLUTION
ONTROL,
orida Univ., Gainesville. Dept. of Economics.
Lusky.
nadian Journal of Economics, Vol. IX, No. 1, p.
-101, 1976. 1 fig., 6 ref.

scriptors: *Recycling, *Mathematical models,
ollution abatement, Waste treatment, Cost allo-
tion, *Waste disposal, Cost comparisons, Op-
nization, Byproducts.
ntifiers: Waste utilization.

A quantitative model attempts to eliminate the negative effect on consumers' utility of pollutant accumulation through comparison of altervative means of reducing the accumulated stock of pollution by recycling and/or disposal. Disposal of pollution materials is usually cheaper than recycling, but the model considers both the positive direct effect of the recycled good on the consumer's utility function and determines the best allocation of resources between the recycling activity and disposal. The procedure considers three activities--production of the original consumption good, production of the recycled good, and disposal--and optimizes the allocation of productive inputs (e.g., labor) between them in order to maximize consumer utility. Conclusions cite an optimal solution in which a decrease of the consumption of the original good is matched by an increase in the production and consumption of the recycled good. The government can assist this optimization through interventional means such as taxes, subsidies and cost guarantees, especially in the case of water and general refuse, which can be recycled commercially but where no viable markets have been developed for recycled products. (Harris-Wisconsin)

THE BIOLOGICAL CONTROL OF ALLIGATORWEED,
Agricultural Research Service, Gainesville, Fla. Biological Control Lab.
N. R. Spencer, and J. R. Coulson.
In: Proceedings on Biological Control of Aquatic Macrophytes, Environmental Protection Agency and University of Florida. Preprint, March 1975. 25 p. 6 fig., 27 ref.

Descriptors: *Biocontrol, *Alligatorweed, *Aquatic weed control, *Insects, Water hyacinth, Florida, Distribution, Predation, Southeast U. S.
Identifiers: Agasicles hygrophila, Amynothrips andersoni, Vogtia malloi, Beetles, Thrips, Moths.

Three South American insects suitable for use as biological control agents for alligatorweed have been cleared for use and are established in the southeast U.S. The first successful release of Agasicles hygrophila, the alligatorweed flea beetle, was in the Ortega River, Jacksonville, Florida. Agasicles prefers aquatic alligatorweed, so terrestrial and semi-terrestrial growth is not affected. Agasicles requires warm temperatures but not exceeding 26C, and is rarely found where alligatorweed is nutritionally deficient. Amynothrips andersoni was imported in 1966, but effective control of alligatorweed has not occurred because of their inability to fly and of predation by flower bugs. Vogtia malloi, the alligatorweed stem-borer, released in 1971, can survive over 30 days of 0 Celcius temperatures. It promises to be the most widespread of the introduced alligatorweed enemies. Biocontrol by Agasicles is still erratic and limited to areas without extreme temperature fluctuations. The stress being put on alligatorweed by these insects should reduce its population and make it an acceptable member of the aquatic plant community in the United States. (Buchanan-Davidson--Wisconsin)

HARVESTING THE OCEAN--ON LAND,
Alexander Marine Research Facility, Cayucos, Calif.
J. A. Alexander.
Agricultural Engineering, Vol. 56, No. 10, p. 66-68, 1975.

Descriptors: Design, *Shellfish farming, *Aquiculture, Crabs, Lobsters, Clams, Sculpins, Diets, Byproducts, Commercial shellfish, Recycling, Desalination, Pollution abatement, Sulfur, Smog, Waste treatment.
Identifiers: *Polyculture, *Mariculture, *Abalone, Shells, Waste utilization.

Mariculture facilities developed to produce abalone provide planting stock for fish, the shells are used for calcium buffering, flocculate minerals, and the entrails feed lobsters, crabs, and cabezon. Drifted kelp is used as feed. Water from the abalone tank flows to cabezon and clam tanks, then crab and lobster tanks finally to steelhead tanks. The system design should avoid copper; concrete is an excellent substrate. Most pumping systems are overdesigned. Shellfish tanks are buffered with crushed oyster or clamshells, which act as substrates for bacteria which break down growth-retarding metabolites into compounds useable by algae. Sulfur greatly accelerates production. Sulfur trioxide controls alkali, mosquitoes, and other pests; is useful in water conservation, and cuts fertilizer requirements. Sulfur-containing smog can be used to produce potable water and bacteria-free sludge for fertilizer or animal feed from domestic sewage. When seawater is used to scrub smog, over 90% of the salt is removed, and can be used for irrigation. Raceways simplify feeding and cleaning. Silo culture can produce enormous yields. Wastes from contained animal culture can be separated to provide potable water and bacteria-free sludge to feed shellfish and finned gill feeders. (Buchanan-Davidson--Wisconsin)

'ZERO-EFFLUENT' THROWAWAY SYSTEM,
Central Illinois Public Service Co., Springfield.
W. J. Holhut, T. R. Nelson, J. H. Wilhelm, and W. Ellison.
Power, Vol. 120, No. 8, p 66-69, August, 1976. 3 fig, 1 tab.

Descriptors: *Electric power industry, *Air pollution, *Sulfur compounds, *Liquid wastes, *Coals, Solid wastes, Waste treatment.
Identifiers: Sulfur dioxide, Flue gas desulfurization, *Zero effluent.

A throwaway flue gas desulfurization system of the double-alkali type which is designed to remove sulfur dioxide from coal-burning power plant stack gas under zero-effluent, closed-liquid-loop conditions is described. Key system operations include: particulate removal with a high efficiency electrostatic precipitator, multiloop wet scrubbing for isolation of collected tramp components from sulfur dioxide, lime post-precipitation of sulfur dioxide absorbed in a scrubber liquor rich in sodium sulfite, and liquid/solids post-treatment designed to assimilate all liquid wastes as surface moisture in dewatered waste solids. The process is scheduled for startup in late 1977 and is believed to be broadly applicable to high-chloride bituminous coal burned in power plants which require stringent management of solid wastes and liquid effluents. Mitsubishi Juko Giho (Mitsubishi Heavy Industries Technical Review), Vol. 13, No. 3, p 487-495, 1976. 15 fig, 3 tab, 3 ref.

Descriptors: *Oil industry, *Oil pollution, Ships, *Water pollution control, *Reclamation, Sludge, Design criteria, Performance, Pollution abatement, Separation techniques.
Identifiers: *Slop tanks(Oil).

The development of an improved slop tank as part of an effort to improve load-on-top systems for the prevention of oil pollution by tankers at sea is described. The slop tank consists of a sludge recovery compartment, an oil recovery compartment, and a settling compartment. Tests conducted by the Nagasaki Technical Institute indicate that the improved load-on-top system is capable of satisfying the discharge regulations for crude oil established at the 1973 Convention of the International Maritime Consultative Organization. A segregated ballast system which was adopted at the same convention is also very effective for the prevention of oil pollution at sea; however, the system is applicable only to tankers built hereafter, whereas the load-on-top system can be employed on existing tankers. (Kreager-FIRL)

QUATERNARY AMMONIUM SALTS CONTROL ODORS,
H. Schwartz.
Industrial Wastes, Vol. 22, No. 4, p 31, July/August, 1976.

Descriptors: *Food processing industry, *Odors, *Waste water treatment, *Ammonium salts, *Bactericides, Effluents, Costs, Toxicity, Organic compounds.
Identifiers: Quaternary ammonium salts, *Oder control.

The use of quaternary ammonium salts for the control of odors in industrial effluents is discussed, with particular emphasis on the food processing industry. Quaternary ammonium salts exert a double deodorant action in that they react directly with the molecules of odorants and also kill microorganisms that might cause future odors. Quaternary ammonium salts are strong germicides with low mammalian toxicity and they are also biodegradable. One disadvantage of these salts is that they are neutralized by organic matter such as protein or cellulose; however, a water-soluble complex of quaternary ammonium salts has been developed which overcomes this disadvantage. A successful application of quaternary ammonium salts for the control of effluent odor at a poultry processing plant is described. The daily cost of this odor control method runs about $2.00 for each 100,000 gallons of plant effluent treated. (Kreager-FIRL)

Descriptors: *Planning, *Long term planning, *Decision making, *Forecasting, *Alernate planning, *Environmental effects, *Social change, *Ecosystems, *Pesticides, Projections, Social aspects, Environment, Social values.
Identifiers: *Social systems, Productive systems, 'Driving' trends.

A set of alternative future forecasts or scenarios are presented for the Environmental Protection Agency (EPA) to use in the planning of pesticide policy. The report is a tool for anticipating issues and gauging the utilities of policies to meet those issues in the years 1975 - 2000. Ten alternative future scenarios were developed through a procedure consisting of the 4 following steps: (1) trend analysis - both major social trends and trends relevant to the EPA were considered, such as value changes, international social changes, energy, food supply and demand; (2) skeletal scenarios - four critical 'driving' trends were identified, energy, climate, food and social values; (3) futures literature review - 16 descriptors of the future (ranging from research reports and non-fiction to science fiction) were assessed in a common format; (4) scenario expansion. Detailed future scenarios were organized into 3 general categories: industrial success within present structures and boundaries; industrial failure, meaning failure of these present institution; industrial transformation. Policy implications relevant to the EPA are: realization of EPA goals will be difficult from 1975 - 1985; a moderately environmentally conscious society will be present from 1985 - 1995; in the long run, environmental attitudes should support the EPA; in the short run (1975 - 1985), considerable tolerance for environmental degradation appears likely, becoming progressively less tolerant after 1985; a considerable number of policy reversals are probable; uncertainty and error must be included in policy planning processes. dards, *Sediments, *Suspended solids, W
quality, Pollution, Pollutants, Rivers, Strea
Biota, Organic matter, Sampling, Geomorphol
Soil erosion, Biology, Sedimentation, Sedim
tology, Sediment control.
Identifiers: *Sediment standards.

Society has a multitude of interests in the qua
of our rivers as it relates to the movement of s
ment. Some of these interests are directly c
tradictory to each other. Reducing suspended s
ment loads in the interest of water quality as
lated to domestic and industrial use or as relate
recreational purposes may result in off-setting
delicate equilibrium of the river's biota due
changes of the food supply or may lead to dra
changes in the river's geomorphic structure. W
the biotic an geomorphic characteristics chang
from river to river, sediment standards can
have the form of absolute upper and lower li
for the total sediment transport. They must be
to the past history of the individual river. St
dards without enforcement are meaningless.
forcement will require monitoring the total s
ment transport at strategic locations. Selectio
such locations again leads to a dilemma. De

ns in sediment transport from some base line
ta must be investigated and their cause deter-
ined, whether it is natural or man-induced. In
der to do so, the deviations must be relatively
rong and the number of possible sources rela-
ely small. This demand puts the monitoring sta-
ns into the far upstream regions of the
atersheds. But this will require a large number of
ations which makes the monitoring at these loca-
ns economically unfeasible. Ideas for possible
lutions were suggested. Special emphasis was on
eas in which knowledge is insufficient for
aching any conclusions and will require exten-
ve research efforts. (See also W77-00775) (Sims-

MARINE POLLUTION ARTICLES IN THE LAW OF THE SEA SINGLE INFORMAL NEGOTIATING TEXT,
Rhode Island Univ., Kingston. Law of the Sea Inst.
D. Livingston.
Occasional Paper Series No. 31 (76-2), June 1976. 35 p, 40 ref. SG-04-6-158-44002.

Descriptors: *Law of the Sea, *Air pollution, *Pollution abatement, *Water pollution sources, *International law, Pollution, Conferences, Coasts, *Environmental effects, Continental Shelf.
Identifiers: Ocean pollution, Pollution sources, Ocean dumping, Ocean environments, Underwater environments, Ship wastes.

Articles on international prevention and control of marine pollution are contained in the document that emerged from the 1975 session of the UN Law of the Sea Conference (LOS). The marine environment was one of the major agenda items of Committee III and its portion of the Text contains 44 articles under the heading 'Protection and Preservation of the Marine Environment,' as well as additional sections on 'Marine Scientific Research' and 'Development and Transfer of Technology.' The analysis in this paper gives a coherence to the topic and focuses on pollution, excluding such cognate areas as scientific research and conservation of resources. The Text is in large part a product of recent international experience in controlling marine pollution and points the way toward a foundation or framework of general obligations which are to enhance and systematize both past efforts and future international negotiations on this subject and to mandate the enactment by states of relevant domestic legislation. THE CANADA WATER ACT, ANNUAL REPORT, 1974-1975.
Department of the Environment, Ottawa (Ontario).
Information Canada, Ottawa, 1975, 34 p.

Descriptors: *Canada, *Water law, *Water resources, *Water quality control, *Administration, Federal government, State governments, Comprehensive planning, Cost sharing, Food control, Social aspects, Economics, Governmental interrelations.
Identifiers: *Canada Water Act, Annual report, Provincial governments.

The provisions of the Canada Water Act embracing the formation of federal-provincial consultative committees, implementation agreements, planning studies and other cooperative arrangements, water quality management and eutrophication control, are summarized. To assist in the implementation of the Act, a decentralization program has been instituted for the negotiation and administration of federal-provincial water agreements; Regional Directorates have been organized in the Pacific and Yukon, Western and Northern Ontario, Quebec, and Atlantic Regions. A water resources research support program is continuing with grants of $1 million shared by 20 universities. The principal federal-provincial cooperative agreements under the Act are listed, showing the entities, cost-sharing arrangements, the objectives, and current status. The surveillance program to regulate phosphorus in laundry detergents and its effectiveness are described. The federal water management capability is supplemented by the Canada Centre for Inland Waters, the document reference center (WATDOC), and the national water quality data bank (NAQUADAT). The systematic collection and compilation of data on streamflow, water levels, sediment transport, groundwater, water quality and related information on glaciers, snow and ice is continuing under a cost-sharing agreement with the provinces totaling $8,760,200. Socio-economic studies are also undertaken under the provisions of the Act. (Auen-Wisconsin)

1974 ANNUAL REPORT, (WASHINGTON NATURAL RESOURCES AND RECREATION AGENCIES).
1974, p. 17-23, 4 fig.

Descriptors: *Washington, *Ecology, *Legislation, *Water management(Applied), *Waste disposal, Penalties(Legal), Water pollution, Flood control, Water utilization, State governments, Discharge(Water), Planning, Water quality, Water law, Environmental effects, Economics, Permits.
Identifiers: Administrative regulations, Comparative law.

The Natural Resources and Recreation Agencies for the state of Washington have provided a broad view of the fiscal year 1974 operations and policies of the state Department of Ecology. The report reiterates the wholistic approach taken by the Department in dealing with controversial issues such as industrial waste discharge permits and whether or not to relax air and water quality standards to increase energy production. Also examined is the impact of 1974 state legislation on Departmental operations. This legislation includes (1) the Noise Act which was designed to complement the

Federal Noise Pollution Act of 1972, (2) the amendments to the state Environmental Policy Act, (3) a Baseline study bill to prevent and control oil pollution, and (4) the Forest Practices Act. The report contains a summary of Department activities in the following areas: civil penalties; air quality; solid waste management; litter control; shoreline management; water quality; flood damage reduction; water use; water planning; DDT spraying; and coordinated environmental permits. Graphs are presented indicating collected civil penalties for 1971-1974, ground and surface water right applications for 1967-1974, sewage facility construction funds for 1970-1974, and environmental grants to local agencies in fiscal year 1974. NONPOINT POLLUTION: AN EPA VIEW OF AREAWIDE WATER QUALITY MANAGEMENT,
Environmental Protection Agency, Washington, D. C. Water Planning Div.
M. Pisano.
Journal of Soil and Water Conservation, Vol 31, No 3, p 94-100, May/June 1976. 7 p, 1 map, 2 photo.

Descriptors: *Federal Water Pollution Control Act, *Sedimentation, *Regulation, *Water quality, *Water pollution sources, Legal aspects, Legislation, Management, Monitoring, Penalties(Legal), Permits, Standards, Water policy, Water quality standards, Water treatment, Water resources, Water pollution.
Identifiers: *FWPCA Amendments of 1972, *Nonpoint sources(Pollution).

Point source pollution by industrial effluents and untreated municipal sewage has been the focal point of American pollution control efforts. If clean water goals are to be met by the 1983 target date, however, nonpoint sources must also be given attention. These sources include agricultural and silvicultural runoff, acid mine drainage, urban runoff, and sedimentation from construction sites. Nonpoint sources account for 92% of all suspended solids in water. The treatment of these solids is specified in the Federal Water Pollution Control Amendments of 1972. Section 208 calls for 'best management techniques' to prevent runoff, as well as other planning procedures. An analysis of the Amendment's potential for fighting nonpoint source pollution is included. (Frank-Florida)

NONPOINT POLLUTION AND WATER QUALITY MONITORING,
Georgia Univ., Athens. Inst. of Community and Area Development, and Georgia Univ., Athens. Inst. of Ecology.
J. Cooley.
Journal of Soil and Water Conservation, Vol 31, No 2, p 42-43, March-April 1976. 2 p.

Descriptors: *Water quality control, *Data collections, *Water pollution, *Water pollution sources, *Monitoring, Water pollution, Water pollution effects, Control, Control systems, Data transmission, Maintenance, Measurement, Operations, Regulation, Water quality, Erosion, State governments.

Monitoring of water quality will be necessary in the effort to control non-point sources of pollution. In addition, baselines of water quality must be established and a continuing assessment of control programs must be provided. Any monitoring system must characterize and define trends in the physical, chemical, and biological condition of water. This monitoring, which should be conducted by the state, will determine if management practices are obtaining the desired results. Because of the cost involved in monitoring all major nonpoint sources both upstream and downstream, the author suggests that sites should be established at carefully selected indicator operations of nonpoint sources within different regions of the state. The author acknowledges, however, that current problems make such site selections untenable for the present. Regardless of site location, periodic samples should be taken when triggered by certain climatic events. The parameters of this monitoring should be controlled by a specially developed systems model of the receiving body of water. The mere outlay of large amounts of money does not guarantee quality; rather, careful preparations should be made before any monitoring system is implemented. (Frank-Florida)

NEW FEDERAL REGULATIONS FOR DREDGED AND FILL MATERIAL,
Smith (David D.) and Associates, San Diego, Calif.
D. Smith.
Environmental Science and Technology, Vol 10, No 4, p 328-33, April 1976. 6 p, 1 illus, 2 photo, 1 chart.

Descriptors: *Navigable waters, *Federal Water Pollution Control Act, *Dredging, *Federal project policy, *Environmental effects, Regulation, Legal aspects, Legislation, Management, Permits, Water policy, Channel improvement, Hydraulic mining, Mining, Excavation, Flood protection, Flow, Judicial decisions.
Identifiers: *Fill permits, *Army Corps of Engineers.

In March 1975, the U. S. District Court for the Districts of Columbia ruled that the responsibility of the U.S. Army Corps of Engineers (ACE) to regulate the discharge of dredged or fill material to navigable waters extends to all waters of the United States. The court also directed the Corps to revise its regulatory procedures accordingly, and the Environmental Protection Agency (EPA) to issue the applicable discharge guidelines forthwith. Prior to the 1975 decision, the Corps had limited the exercise of its responsibilities to the navigable waters of the U. S. This could be reasonably defined, but 'all water' is a vague phrase not defined by Congress or the courts. The purpose of this article is to explain the interpretation of 'all waters' ultimately arrived at, as well the EPA guidelines that followed the decision. These guidelines provide no single technical evaluation procedure for nationwide use; rather, they provide for various types of test procedures, including mechanical analyses, elutriate tests, total sediment chemical analyses, bioassays, and biological evaluations. These guidelines must be reviewed at least once every three years and revised as indicated by the accumulation of information from pertinent research. (Frank-Florida)

PAYING TO POLLUTE.
Environment, Vol 18, No 5, p 16-20 (1976). 5 p, 3 photo.

Descriptors: *Water policy, *Water pollution treatment, *Water pollution control, *Economic efficiency, *Costs, Benefits, Planning, Marginal utility, Marginal productivity, Marginal benefits, Air pollution, Marginal costs, Pollution charges(Taxes).
Identifiers: *Organisation for Economic Co-Operation and Development.

There are two main schools of thought on pollution control: those who advocate the direct imposition on polluters of regulations, usually emission standards; and those who argue for a levy on polluting wastes. The latter is the pollution charge approach, which is being evaluated in Europe by the Organisation for Economic Co-Operation and Development (OECD). OECD's study has ascertained that, even when used as the principal policy instrument, pollution charges are always combined with direct control. Several countries are planning to turn to pollution charges, among them Germany, the Netherlands, and France. Examples of the use of pollution charges are given in regard to water pollution, air pollution, noise and solid wastes. The following conclusions are reached: (1) that systems of charges should be as simple and easy to manage as possible; (2) that decentralization of management should be used to provide the best pollution charge framework; (3) that the public should be involved in running the system of charges; and (4) that charges should rise over time so as to strengthen the disincentive until the desired environmental objectives are attained. (Frank-Florida)

PROTECTION OF THE MARINE ENVIRONMENT FROM POLLUTION,
R. A. Frank.
Georgia Journal of International and Comparative Law, Vol 6, p 73-91 (1976). 19 p, 55 ref.

Descriptors: *International law, *United Nations, *Law of the sea, *Pollution, *Oceans, Water pollution, Environmental effects, Water pollution sources, Mining, Oil spills, Oil wastes, Legal aspects, Water law, Navigation, Water pollution control, Foreign countries.

Discussed here are six issues relating to the protection of the marine environment from pollution in the context of the Third United Nations Conference on Law of the Sea. They are: (1) vessel source pollution; (2) control of deep seabed mining; (3) landbased sources of pollution; (4) pollution from resource activities in the economic zone; (5) environmental monitoring and assessment; and (6) the double standard. Concerning the double standard, developing nations have insisted that they be subjected to less stringent requirements than those required of the developed countries with respect to virtually every environmental protection obligation. The author concludes that clear limitations should be placed on any double standard. They would include limiting it to land-based activities, requiring a case by case showing that substantial economic injury will result if pollution controls of a certain kind are adopted, and insuring that toxic and hazardous substances remain under the most stringent pollution control standards. None of these, however, has yet been reduced to draft form. (Frank-Florida)

Coastal Zone Management Act of 1972 was ned to help coastal states inventory their front resources and draw up long-range plans nage those resources wisely, as well as to de planning grants to speed up the process. r President Ford, however, the intent of the ation has been avoided, and indiscriminate ore drilling has been encouraged in an effort crease the gross national product. Like g, the leasing of offshore areas has also eded at an astronomic rate. Areas encom- d by these leases include Cape May, Long d, the Alaskan shore, and a large stretch of alifornia coastline, all of which will subject to tial oil spillages on the order of the Santa ara disaster of a few years ago. Yet even with threats, no federal thought is being given to ing for the survival of these coastal areas. is unfortunate since potential solutions do For instance, increased federal efforts in erving oil and gas, especially in the auto in- y, could obviate much of the need for new g. Until such efforts are initiated, however, l companies will continue to push for speedy nsion of offshore drilling. (Frank-Florida)

ORGANIC CHEMICALS MANUFACTURING POINT SOURCE CATEGORY--EFFLUENT LIMITATIONS, GUIDELINES AND STANDARDS.
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 40, No 233, p 56436-42, December 3, 1975. 7 p.

Descriptors: *Federal Water Pollution Control Act, *Chemical industry, *Waste water treatment, *Water quality standards, *Regulation, Standards, Administrative agencies, Federal government, Biochemical oxygen demand, Chemical oxygen demand, Chemicals, Industrial wastes, Toxicity, Potable water, Effluents, Costs, Economic impact, Water quality control, Pollutants, Public health, Aquatic life, Cost-benefit analysis, Pollution.
Identifiers: *Carcinogens, Administrative regulations.

The Environmental Protection Agency (EPA) has established final amendments to the regulations setting guidelines and standards for effluent limitations for the ethylene oxide, ethyl glycol, methyl amines, and oxo chemicals production subcategories of the organic chemicals manufacturing point source category. Both the guidelines representing the degree of effluent reduction attainable when applying the best practicable control technology currently available and the standards of performance for new sources set limitations on the effluent characteristics of BOD5, TSS, and pH. The guidelines representing the degree of effluent reduction attainable by application of the best available technology economically achievable include limitations on the effluent characteristics of COD, BOD5, TSS, and pH. The EPA has summarized the comments made on the regulations by members of the chemical industry and has responded to the comments. In an analysis of the potential benefits and costs of the regulations, the EPA points out that since some organic compounds are carcinogenic and some are toxic to aquatic life, their presence in the nation's water is a potential health hazard. (Capehart-Florida)

ENVIRONMENTAL PROTECTION AND ENHANCEMENT (GENERAL GUIDANCE TO ELEMENTS WITHIN THE DEPARTMENT OF THE ARMY ON ENVIRONMENTAL PROTECTION).
Office of the Cheif of Engineers (Army), Washington, D. C.
Federal Register, Vol 40, No 232, p 55962-83, 55999-56013, December 2, 1975. 37 p, 16 fig, 2 map.

Descriptors: *Environmental effects, *Regulation, *Pollution abatement, *Environmental control, *Federal government, Water pollution control, Air pollution, Administrative agencies, Standards, Water treatment, Waste water treatment, Water conservation, Pollutants, Effluents, Recycling, Oil spills, Toxins, Navigable waters, Legislation, Landfills, Flood plains, Channels, Federal Water Pollution Control Act, Construction.
Identifiers: *Administrative regulations, *Environmental impact statement.

The Department of the Army is adopting a regulation specifying policies, responsibilities, and procedures for the protection and preservation of environmental quality. The goal of the Army is to minimize adverse environmental effects without impairing the Army's mission. Responsibilities for reviewing environmental policy, proposing new programs, and coordinating activities are delegated to specific branches within the Army. An annual status report will be prepared on environmental programs and activities. Subpart B of the regulation deals with environmental considerations in Army actions. The types of actions requiring an environmental impact assessment or an environmental impact statement (EIS) are listed. The factors to be considered in determining the environmental impact are detailed. The outline of an EIS is included. Subpart C covers the procedures for implementing the Federal Water Pollution Control Act. Subpart D relates to air pollution abatement procedures. Subpart I contains the procedures for control of discharge of oil and hazardous substances. Subpart J specifies the reporting procedures to be followed within the Army to control environmental pollution from existing facilities. Sample reports are included. (Capehart-Florida)

OCEAN DUMPING; PROPOSED SITE DESIGNATION.
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 41, No 85, p 18094-95 April 30, 1976. 2 p.

Descriptors: *Toxins, *Chemical wastes, *Incineration, *Gulf of Mexico, *Sites, Waste disposal, Toxicity, Oceans, Administrative agencies, Federal government, Regulation, Wastes, Ultimate disposal, Disposal, Water quality, Water quality control, Organic compounds, Chlorine, Water pollution sources.
Identifiers: *Ocean disposal, Organic chlorine compounds.

The Environmental Protection Agency is proposing the designation of a site in the northwestern part of the Gulf of Mexico for use in the incineration of highly toxic chemical wastes. The primary use of the site will be for the incineration of organo-chlorine wastes. Studies on the area of the proposed site show little or no environmental impact from incineration of chemical wastes. Ocean incineration has therefore been determined to be an environmentally sound alternative method for disposal of these wastes. (Capehart-Florida)

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM AND STATE PROGRAM ELEMENTS NECESSARY FOR PARTICIPATION.
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 41, No 30, p 6281-3 Feb 12, 1976. 3 p.

Descriptors: *Lumbering, *Forest management, *Water quality standards, *Permits, *Regulation, Judicial decisions, Administrative agencies, Federal government, Standards, Pollutants, Water pollution, Percolation, Precipitation(Atmospheric), Runoff, Navigable waters, Burning, Pesticides, Lumbering, Gravels, Rocks, Water quality control.
Identifiers: *Administrative regulations, *National Pollutant Discharge Elimination System.

In compliance with an order of the federal district court, the Environmental Protection Agency (EPA) is proposing regulations which apply the National Pollutant Discharge Elimination System permit program to point source discharges in the silviculture category. Previous regulations excluded this category from permit requirements. The proposed regulations distinguish between point source and non-point source water pollution. Silvicultural activities resulting in water pollution are not subject to the permit program if the pollution is caused by natural processes and is not traceable to any specific facility. Excluded activities include nursery operations, site preparation, controlled burning, pesticide control, and harvesting operations. Permits with effluent limitations will be required for discharges from point sources such as rock crushing, gravel washing, log sorting and log storage facilities. (Capehart-Florida)

Identifiers: *Ocean dumping, *Marine protection, Research and Sanctuaries Act of 1972.

Ocean dumping of wastes and sewage is continuing at a steady and high rate. As a result of this dumping, large areas of ocean are being seriously harmed, and fish catches are being depleted. Part of the reason for this increase in harmful dumping is that the Marine Protection, Research and Sanctuaries Act of 1972 which was designed to regulate ocean dumping is not being enforced. Under this Act, dumpers of dredge spoils are supposedly required to obtain a permit from the Army Corps of Engineers while all other dumpers are required to obtain a permit from the Environmental Protection Agency. Unfortunately, there are numerous ways by which these agencies may circumvent the regulations they are supposed to enforce. Two other major obstacles to effective long-term regulation of ocean dumping are that of accurately measuring the effects of such dumping, and the present absence of feasible alternatives. The author concludes that man's chance of survival will be seriously reduced if steps are not taken to prevent the indiscriminate pollution of the sea caused by dumping. (Frank-Florida)

Descriptors: *Optimization, *River basins development, *Decision making, *Comprehensive planning, Model studies, *Optimum development plans, Simulation analysis, *Pennsylvania, Multiple-purpose projects.

A new computational approach has been developed for the practical solution of the nonlinear, stochastic optimization problem representing many complex river basin decision problems. This approach involves a simulation, model, a computational scheme for estimating marginal net benefits due to changing each decision variable, and a search procedure. The approach was tested by application to three example problems using data from an actual river basin planning study. An early motivation for this research was the need for an improved planning approach to resolve the great differences between screening (or optimization) model results and simulation model results when these systems analysis tools were used in actual planning practice. Screening models of complex systems usually must neglect important stochastic or nonlinear relationships (or else become computationally intractable). Since the role of screening models in planning would be to aid in plan formulation and since screening models fail to recognize very important aspects, it follows that better plans may exist than would be suggested by existing screening models. The research results have not yet been applied in an actual planning project, and its was beyond the scope of the work to make such an application. Nevertheless, the need for this research did derive directly from a river basin planning study supervised by the principal investigator. Also, the simulation model developed under this project has been u in a study for the U.S. Army Corps of Engineer Water Resource Development in the South Cen Pennsylvania Region. This study shows the development of a sea package for use in the optimization of non-lin stochastic water resources systems from a m objective viewpoint. Multiobjective theory c bles one to aggregate the net benefits toward v ous objectives as a sum of weighted bene which may be regarded as the response of system for a certain project configuration. Rec advances in simulation techniques have resulte simulation models which not only predict responses of a system but also provide estima of the partial gradients on the response surfa These gradient estimates are useful in that they dicate the changes in project configurations wh would result in an improved response. This st

aimed at finding a search technique which can
ke efficient use of the inexact gradient esti-
es in locating the maximum point on the
onse surface. Study and testing of various
rch techniques indicated that Steepest Ascent
a modified version of Pattern Search made the
t efficient use of gradient estimates. These two
hods were combined in a small search package
ch was then tested, in combination with a
ulation model, in the optimization of several
mple water resource systems. The results
wed the combination of search and simulation
e very effective on small systems at least. (See
W77-00532).

chnique superior to the best methods currently
se to calculate optimal harvest rates for mixed
stocks using stochastic dynamic programming
escribed. The main advantages of this method
(1) The stock recruitment model can have un-
ted complexity as the number of parameters in
model does not affect the computation
uired or the reliability of results; (2) parameters may be stochastic but as the number of stochastic possibilities considered for the parameter values increases so does the computation time; (3) there may be judgmental uncertainty about parametric values; while this is analogous to stochastic variability of parameters, it is conceptually distinct; (4) the objective functions (maximization) can be as complex as desired; it need not be restricted to long-term catch--it can be catch dollar value, total employment generated from the fishery, or any combination of factors; (5) discounting rates can easily be introduced. The total objective does not need to be summed over time but may be multiplicative over time. Although the number of computations goes up linearly with the number of time intervals, it does go up geometrically with the number of state variables and stochastic parameters, thus practically optimizing models are restricted to, at most, five state variables. Descriptors: *Regional analysis, *River basin development, Water resources development, Land resources, Cost sharing, *Financial feasibility, Long term planning, Low flow augmentation, Water quality control, Multiple purpose projects, *Planning, *Coordination, *Land use, *Comprehensive planning, Cost analysis, Community development.
Identifiers: Regional coordination, Simplified modeling, Fiscal cost analysis, Community development planning, Site development cost modeling, Regional water balance.

This research addresses three of many requirements for interfacing water and land resources planning: (1) need to coordinate separate resource planning activities and assign regional priorities; (2) need to relate environmental, social and economic benefits and costs of community land use plans to similar decision criteria at the regional water resources planning level; (3) need to quickly convert land use information into water resource requirements and costs. Results include: (1) simplified quantitative procedures based on regional water, land and mass balance relationships and demonstrated in the Platte River, Nebraska Level B regional study; (2) an improved fiscal cost analysis procedure for short term land use decisions based on economic, social and environmental goals, demonstrated in Richmond, Calif.; (3) extension of site development cost models to analyze housing cost associated with community use policies, demonstrated in Napa, California. Recommendations include: The physical conservation relationships developed in this study should be further refined, especially for mass balance related to water quality determinations, in order to focus these quantitative procedures toward integration of water quality planning with water quantity planning. A study should be undertaken to implement the project's fiscal analysis methodology in a community undergoing development pressures in order to obtain operational experience with incorporating the fiscal analysis procedure in the urban land use planning process. A further study should be made predicting demand characteristics for housing. Using the housing cost models developed to provide the cost for the type of house being demanded in an area would provide input into the effect that land use policies associated with the general plan will have on the future cost of homes in a community.

Descriptors: Technology, Water resources development, Planning, *Projections, Forecasting, Input-output analysis, *Southwest U.S., *Alternative planning, *Water allocation(Policy), Arid lands, *Future planning(Projected), *Long-term planning, Project planning, Economic impact, *Social impact.
Identifiers: *Arid West, *Technology assessment.

Given historical trends and present conditions in the arid West, new water supplies are expected to have far-reaching consequences for the economic life of the region and drastic alterations in lifestyle. In using the theme that water resources planning is future-oriented, methods of technology assessment are utilized for tracing possible effects of legislative proposals, new technologies or other water actions and programs which may pre-ordain a whole lifestyle change in the region. Three clusters of technology assessment methods are used to illustrate the usefulness of this approach, namely descriptive (e.g., dynamic modeling and cross-impact matrices); predictive (such as trend extrapolation and correlation); and, prescriptive (including Delphi, decision trees and scenarios). Finally, the approach also emphasizes the socio-political character within which judgments of technology assessment as to potential or preferable futures can be made in order to reach balanced decisions concerning long-range impacts of water resources development.

THE ECONOMIC WATER SUPPLY IN IDAHO,
Idaho Univ., Moscow. Dept. of Agricultural Economics.
W. C. Bailey, and R. B. Long.
Available from the National Technical Information Service, Springfield, VA 22161, as PB-259 280, Price codes A02 in paper copy, A01 in microfiche. University of Idaho Agricultural Experiment Station, Research Bulletin No. 92, April 1976. 20 p, 8 fig, 9 tab, 17 ref. OWRT A-044-IDA(2). 14-34-0001-5012.

Descriptors: Costs, Economics, *Cost analysis, Unit costs, *Economies of scale, *Regression analysis, Least squares method, *Water supply, Supply, *Elasticity of supply, Prices, *Idaho, Municipal water, Irrigation water, Industrial water.
Identifiers: Supply curve.

Costs involved in making water available for use in Idaho were examined. Making the quantity of water available where needed involves costs for capturing, transporting, and distributing the water supply from existing sources. In examing the cost for making water available for use in Idaho, the water supply industry was segmented into three categories: municipal, industrial, and irrigation. Primary and secondary sources were used in the collection of the data from these three categories. Least squares regression analysis was performed on the data to estimate the relationship between total, fixed and variable costs, and water output for each category. The results of the regression analysis showed there is a reasonably high correlation, 0.70 to 0.81, between cost and output. The economic interpretation of the regression results indicated the water industry in Idaho is in Stage I of a standard production function and subject to economics of scale. In other words, costs of producing water tend to fall as output increases. Supply curves for these water categories were shown to be downward sloping and highly elastic. Results indicated sufficient water is available in Idaho to meet present and foreseeable needs. If past experiences can be used to predict the future, increased demands for water in Idaho can be met by further natural resource development.

NEW TECHNIQUES FOR POLICY EVALUATION IN ECOLOGICAL SYSTEMS: METHODOLOGY FOR A CASE STUDY OF PACIFIC SALMON FISHERIES,
British Columbia Univ., Vancouver. Inst. of Animal Resource Ecology.
R. M. Peterman.
Journal of the Fisheries Research Board of Canada, Vol. 32, No. 11, p. 2179-2188, 1975. 5 fig., 16 ref.

Descriptors: *Decision making, *Methodology, *Optimization, *Graphical methods, Ecosystems, *Canada, Management, Alternative planning.
Identifiers: *Nomogram technique, Pacific salmon fishery, *Skeena River(British Columbia).

The nomogram technique to help decision-makers evaluate the relative merits of policy options is described and applied to a salmon management problem. The nomograms provide an instant review of information relevant for making a decision--in effect they are a graphical information retrieval system. They demonstrate certain limits to the ecosystem, allow experimentation with alternative plans merely by moving the plastic overlay with its pointers, and can include constraints on management imposed by desired maximum or minimum limits. In applying this decision-making method to the Skeena River (British Columbia) Pacific salmon fishery, other functions of the nomograms emerged: (1) Trade-offs between components of objectives or goals become readily apparent; (2) the steepnesses of the slopes on the surfaces indicate the degree of deviation from the optimal management policies if they are not exactly achieved; (3) individual value judgments and biases can be used to distinguish relevant impact indicators and their relative importance; (4) measures of resiliency or ability to cope with unexpected changes in the ecosystem can be included; (5) different nomogram surfaces can be combined into one composite either by mathematical weighing and summing or by using plastic overlays. The user can explore the changes in optimum policies caused by using different impact indicators with different weightings, and can assume different economic conditions. (Auen-Wisconsin)

THE THEORY OF WELFARE COST MEASUREMENT,
Minnesota Univ., Minn. Dept. of Economics.
J. C. Hause.
Journal of Political Economy, Vol. 83, No. 6, p. 1145-1182, 1975. 2 fig., 2 tab., 55 ref.

Descriptors: *Econometrics, *Welfare(Economics), *Theoretical analysis, Social aspects, Measurement, Estimating.
Identifiers: *Welfare change measurement, Preferences.

Economists have not yet arrived at a consensus about the history, theory and application of welfare cost measurement as based on consumers' surplus concepts, although such measurements are widely used in empirical studies such as those developed for pollution control. In an effort to bridge this theoretical gap, this study attempts to clarify the conceptual framework underlying welfare change measurements. Elements include: (1) welfare change measurements for an individual with known, consistent preferences; (2) estimation of welfare change measures from an individual's demand functions; (3) welfare change measurement for a group of individuals; and (4) measurement of intertemporal welfare change with and without distinct commodities as part of the consumption bundle. To better illustrate key ideas the theoretical work, use is made of comparis for alternative consumption opportunities avai ble to an individual with consistent preferenc No normative conclusions are intended as t work focuses on conceptual characterization net positive (or negative) compensation that wo required by one or more individuals with c sistent preferences to make one situation utili equivalent to another. Descriptors: *Travel time, *Evaluati *Estimated benefits, *Recreation, *Theoreti analysis, Costs, Use rates, Parks, Recreati facilities, Transportation, Northeast U.S.

In studies made to assess primary econo benefits of outdoor recreation, estimation is creasingly made on the basis of consumers' s plus. But because recreation services are free o negligible prices, demand curves must be impu from limited price/quantity information. T Hotelling-Clawson-Knetsch method (HCK, travel-cost technique) is customarily used to pute such recreation site demand curves. Bu fundamentalal problem with HCK analysis is difficulty of fixing the value that consumers recreation services place on the travel time nec sary to reach them. To overcome this problem theoretical model of travel-time valuation developed in which the value of time with resp to nonwork travel was between 1/4 and 1/2 wage rate. The model was empirically tested outdoor recreation use data from 11 state park the northeastern United States. Benefit estima were generated under three assumptions: (1) ign ing travel time; (2) using an ad hoc methodol previously developed by Cesario and Knets and (3) valuing travel time according to the new developed model. Results showed that benefit e mates from the Cesario model substantially ceeded estimates made when travel time ignored but were substantially lower than th produced by the ad hoc Cesario-Knetsch meth Further refinements are sought through contin application of the model to empirical studi (Harris-Wisconsin)

ailable from the National Technical Informa-n Service, Springfield, VA 22161 as PB-246 004,
ce codes: A05 in paper copy, A01 in microfiche.
epared for the New ENgland River Basins Com-ssion, March 1974. 78 p, 15 fig, 3 plates, 9 tab, ref, append. CRS-NERBC-BOR 1.6B (1.1).
S-NERBC-BOR 1.6B (1.1).

scriptors: *Recreation, *Reservoirs, *Access ites, *Connecticut River, *Recreation demand, ecreation facilities, *Reservoir operation, ater allocation(Policy), Water quality, Water orts.
ntifiers: *New England River Basins Commis-n, Statewide Comprehensive Outdoor Recrea-n Plan(SCORP), Wild and scenic rivers, Flat-ter recreation resource, Flowing water recrea-n resource.

1972 the New England River Basins Commis-n (NERBC) requested that the Northeast Re-n of the Bureau of Outdoor Recreation par-ipate in the Supplemental Study of the Water d Land Related Resources of the Connecticut ver Basin. The report discusses supply and de-nd for selected recreation activities in 1980, 0 and 2020; and suitability of recreation on od plain lands; identifies outdoor recreation pri-ties; summarizes inventories of natural and n-made lakes of 100 acres or more; compares sting demand for and access to boating oppor-ities and future demand and access to boating; d summarizes recreation streamflow benefits alysis. Recommendations are: local plans veloped by Statewide Comprehensive Outdoor creation Plans (SCORPs) be accepted and sup-rted; basin states, through their SCORPs con-ue to provide access and recreation facilities on water bodies of the Connecticut River Basin; ntinue studies to identify primary and secondary wnstream uses and the effects of controlled ease flow on ecology of these streams; optimum reation potential should be considered when nning for flood plains, local protective works d new impoundments; recreation potential of sting water resource developments should be ntinually examined to insure maximum use. commended priorities are: improve water quali-throughout the basin with emphasis on the main m of the Connecticut River; improve public ac-s to the basins' water; develop water resources ponsive to urban pressures; recognize recrea-n needs at hydro-electric power developments. entry-North Carolina)

GUIDE PLAN REPORT, ANDROSCOGGIN RIVER BASIN, MAINE AND NEW HAMPSHIRE, REGIONAL AND INTERSTATE OVERVIEW.
New England River Basins Commission, Boston, Mass.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 613, Price codes: A05 in paper copy, A01 in microfiche.
Prepared for Maine State Planning Office, Draft report NERBC-26, May 1974. 80 p, 16 fig, 5 tab.

Descriptors: *Environmental control, *Environmental effects, *Flood protection, Dams, *Planning, *Water quality, *Flood control, *Decision-making, Flood plains, Fish management, Wildlife management, Recreation, Flood insurance, Land use.
Identifiers: *Androscoggin River Basin(ME-NH), Northern States Guide Plan, North Atlantic Regional Water Resources Study, Lake Umbagog region.

An overview of natural resource issues, problems and opportunities in the Androscoggin River Basin is presented with recommended program priorities to meet these problems. The Northern States Guide Plan program was begun in January 1972. Issues were analyzed in light of the Corps of Engineers' 1972 North Atlantic Regional Water Resources framework study which concluded that the management of the basin reflect its high environmental quality and remoteness. Conclusions referred to: characteristics of the basin influencing the use of water and related land uses; regional and interstate aspects of power, critical environmental areas, recreation, flood damage reduction, and water quality. The status of ongoing water and related land resources data collection, analysis and planning programs is described. Recommendations included: the Oquossoc No. 1 pumped storage power site in ME should not be developed for other uses until New England peak power needs are analyzed; minimum flow requirements and wild and scenic sections should be considered when evaluating potential power sites; alternative means of resource allocation necessary to properly manage the basin's critical areas (especially the Lake Umbagog region) should be investigated; studies should be made of the infrastructure needs, fish and wildlife management program needs, potential resource use conflicts and project priorities in recreation areas; land use controls should be adopted where they do not already exist; requirements should be met for HUD's flood insurance program; the importance of natural streamflow regulation in a basinwide flood damage reduction program should be evaluated. (Gentry-North Carolina)

THE SHRIMP FISHERY OF THE SOUTH ATLANTIC UNITED STATES: A REGIONAL MANAGEMENT PLAN.
South Carolina Wildlife and Marine Resources Dept., Charleston. Marine Resources Center.
South Carolina Marine Resources Center, Charleston, Technical Report No. 8, June 1975. 73 p. 5 fig., 2 tab, 10 ref. Edited by P. J. Eldridge and S. A. Goldstein. NOAA 03-3-042-29.

Descriptors: *Commercial shellfish, *Shrimp, *Management, South Carolina, North Carolina, Georgia, Florida, Coordination , Costs, *Planning, *Southeast US, *Regional analysis, Atlantic Ocean.
Identifiers: *Regional management, South Atlantic coast.

In order to provide maximum sustained benefits for the region, the proposed shrimp management plan is oriented to the goals of sustaining the fishery so that the catch levels can be maintained at least at the average of the 1955-1970 period until 1980; to identify by 1978 the potential expansion of harvest by better utilization of existing species and exploiting underutilized species; to establish economic criteria by 1978 for evaluating and initiating management action based on social parameters. The core of the plan is a regional catch and effort statistics program which would provide for collection of economic and biological data. This statistical program should have the capability of being expanded to include other fisheries. The principal advantage of this new system is that the management will coincide with the geographical distribution of the shrimp resource. The basic organizational structure of the management system is illustrated and is headed by a Management Council which will set regional policy. Technical Committees with supporting groups would be appointed as necessary. Recommendations for the consideration of the Management Council are listed in the order of priorities. The costs of the management plan are estimated to be approximately $3 million for each five year period. (Auen-Wisconsin)

A PLAN FOR MICHIGAN'S SHORELANDS.
Michigan Dept. of Natural Resources, Lansing.
1973. 135 p, 29 fig, 64 photo, 17 tab, 10 ref, 4 append.

Descriptors: *Michigan, *Lake shores, *Erosion control, *Great Lakes Region, *Long-term planning, Analyticial techniques, Evaluation, Flood control, Land management, Shores, Decision making, Forecasting, Environmental effects, Shore protection, Beach erosion, Water law,

Water policy, Regulation, Control, Conservation, Management, Administration, Legislation.
Identifiers: Shoreland planning, Shoreland management.

Pursuant to the Shorelands Protection and Management Act of 1970, the Michigan Department of Natural Resources has developed a broad management program for the use and protection of state shorelands. This program has had to integrate many factors. Examined here are the following: (1) the character of state shorelands; (2) shore erosion and flooding; (3) environmental areas of concern; (4) general shoreland problems; (5) management guidelines; (6) existing regulatory shoreland management techniques; and (7) state and federal shoreland programs. Through numerous photographs and charts, this booklet illustrates the variety of shore problems it is hoped the plan will alleviate or solve. (Reinders-Florida)

ECONOMIC AND WATER USE IMPACTS ASSOCIATED WITH ALTERNATIVE WATER PRICING POLICIES OF ESTABLISHED IRRIGATION DISTRICTS,
Oregon State Univ., Corvallis. Dept. of Agricultural and Resource Economics.
W. E. Schmisseur.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 559, Price codes: A05 in paper copy, A01 in microfiche. Oregon Water Resources Research Institute, Corvallis, Completion Report WRRI-47, September 1976. 78 p, 40 tab, 13 ref, append. OWRT A-022-ORE(1).

Descriptors: *Linear Programming, *Irrigation districts, *Pricing, Irrigation, Sprinkler irrigation, *Alternative costs, Model studies, *Oregon, Water policy, *Alternative water use, *Economic impact, *Water costs.
Identifiers: *Responsive pricing(Irrigation).

A linear programming model of two diverse, operating irrigation districts in Oregon is used to identify technical and economic effects attributed to fixed cost, base allotment, and responsive water pricing. From this district specific analysis general guidelines are developed relative to water pricing policies and their impacts. Water diversion and peak use were greater with fixed cost pricing than with either base allotment or responsive pricing. For base water allotment pricing to be effective in rationing water use however, the base allotment should be set at a level where variable charges come into play and these charges must be high enough to moderate water use. Relative to fixed cost pricing water costs were appreciably increased and crop returns were reduced with either base allotment or responsive water pricing. With either of these pricing schemes, the highest water cost and greatest reduction in crop returns on an irrigated acre basis were borne by the less water and yield efficient farms. Relative to base allotment pricing, net water revenues of the district were greater with responsive pricing. The smallest range in water cost either on an irrigated acre or acre foot basis occurred with responsive pricing. The smallest range in water cost either on an irrigated acre or acre foot basis occurred with responsive pricing.

USE PATTERNS FOR DEPLETABLE AND RECYCLEABLE RESOURCES,
John F. Kennedy School of Government, Cambridge, Mass.
M. C. Weinstein, and R. J. Zeckhauser.
In: 1974 Symposium 'On The Economics of Exhaustible Resources' sponsored by the Review of Economic Studies, p. 67-78. 5 fig., 15 ref.

Descriptors: *Recycling, *Economic efficiency, Model studies, Market value, Interest rates, Resources development, Marginal costs, Optimization, Prices, Mathematical models, Costs.
Identifiers: *Depletable resources.

The question of whether market forces can bring about an optimal amount of recycling is addressed, using a simplified multi-stage model of resources such as iron, aluminum and various heavy metals, which are in limited supply. First a variety of models are examined to see how the significant presence of depletable resources would affect market interest rates. It is concluded these cases can be generalized to the case where interest rates are determined endogenously. Second, several models of markets for recycleable resources are analyzed. These include the following cases: nondepletable resources with zero recycling cost, partially depletable resources with zero recycling cost, recycleable resources with zero extraction costs, recycleable resources with constant marginal extraction costs, and recycleable resources with increasing marginal extraction costs. In the most general case, extraction costs increased with the amount extracted. After an initial period of extraction, a period of coexistence of recycling an extraction activities occured similiar to that o present and projected situations. Capital marke and information were assumed to be perfect an storage costs to suppliers were assumed to be zer in all cases. It is shown in every case that the s cially optimal time stream of consumption identical to the stream produced by perfectly com petitive markets. (Luedtke-Wisconsin)

RICULTURAL AND ENVIRONMENTAL IMCTS AS A RESULT OF INCREASED DENDS FOR ENERGY DEVELOPMENT,
Energy, Water, and the West, November 2-5, 5, Albuquerque, p 37-43, May 1976. 5 append.

Descriptors: *Rehabilitation, *Environmental engineering, *Energy, *Land management, *Food and cover crops, Agriculture, Food abundance, Coals, Oil shales, Water utilization, Impoundments.
Identifiers: *Extractive use.

Water will be needed for all phases of energy development in western states, including rehabilitation of the areas mainly requires establishing and maintaining native vegetation, while oil shale areas have the problem of salt management. Water is not expected to be a limiting factor in either process. Other significant environmental changes associated with energy development are more significant; these include impoundment, reallocation and extractive use with streams and water supplies. The possible effects of such changes are described, including those on agriculture, livestock and wildlife patterns, and salt buildup with extractive use. The role of energy in the world's food and fiber ecosystems is analyzed. The need for increased food production places greater demands on the already limited water resources in the West. WATER RESOURCES IN THE WESTERN STATES: PROGRAM POLICY INITIATIVES.
In: Energy, Water, and the West, November 2-5, 1975, Albuquerque, p 55-63, May 1976. 5 append.

Descriptors: *Water resources development, *Water requirements, *Planning, *Water management(Applied), *Water importing, Texas, Colorado, Wyoming, New Mexico, Colorado River Compact, Legal aspects, Water supply, Water demand, Energy, Water transfer, Costs.
Identifiers: Trans-Texas Canal System, Western US.

Water resources planning in Texas, Colorado, Wyoming and New Mexico is discussed by representatives from those states. The Texas Water Plan assumes the state will be water-deficient within the next 50 years and projects importation of 8 to 10 million acre-feet a year using the Trans-Texas Canal System to carry water from the East. Water transported by the canal to Texas and New Mexico would be used mainly for agricultural purposes. Wyoming water laws and interstate compacts are discussed and the Wyoming Water Planning Program outlined. In Colorado, a study by the University of Denver Research Institute analyzes ten methods for reducing or eliminating the water supply/demand gap, including transmountain diversion, construction of new storage facilities, use of groundwater, weather modification and wastewater reuse. The study also presents a methodology for integrating information about additional water needs with techniques available and emphasizes the total cost of each alternative, including indirect economic effects, interest subsidies, social and environmental impacts and legal aspects. Some of these effects are discussed. Water requirements for energy production in New Mexico may constitute 5 to 10% of total projected water needs by 2020. Effects from the Colorado River Compacts are analyzed, along with possible impacts of energy production water use in the state. (See also W77-00542) (Jahns-Arizona)
W77-00547

VIEWS FROM THE ENERGY INDUSTRIES.
In: Energy, Water, and the West, November 2-5, 1975, Albuquerque, p 67-70, May 1976. 5 append.

Descriptors: *Energy, *Industries, *Industrial(Water), *Coals, *Oil shales, *Slurries, Water requirements, Economic feasibility, Colorado, Wyoming, Planning, Water allocation(Policy), Pipelines.
Identifiers: Western U.S., Trans-Texas Canal System, Montezuma Pump-Back Storage Project.

A projected slurry pipeline from Gillette, Wyoming to White Bluff, Arkansas is expected to carry 25 million tons of coal each year starting in 1985. Slurry manufacture is described and its water use and energy-saving features analyzed. In a minemouth power plant built in Wyoming, seven times as much water would be evaporated as a slurry pipeline needs for the same amount of coal. Such pipelines use about 15,000 acre-feet of water a year or 20.7 cubic feet per second. Water requirements are substantial for both coal gasification and oil shale development. Many potential coal gasification projects in the West are still seeking a viable water supply. Oil shale developers in Colorado have filed for over 800,000 acre-feet of water in the Colorado and White Rivers; several with senior rights are building conversion works and planning storage reservoir construction. A reliable water source is required before projects will proceed. Issues of public policy must be resolved first on water allocation, interbasin conflicts, water quality, withdrawals for wild and scenic rivers and other problems. The Trans-Texas Canal System and development of the Montezuma Pump-Back storage project (Arizona) are also discussed. (See also W77-00542) (Jahns-Arizona)
W77-00548

NONWATER-INTENSIVE ENERGY RESOURCES.
In: Energy, Water, and the West, November 2-5, 1975, Albuquerque, p 73-76, May 1976. 5 append.

Descriptors: *Water requirements, *Energy, *Electric powerplants, Economic feasibility, Hydrothermal studies, Geothermal studies, Solar radiation, Wind pressure, Winds, Cooling, Energy conversion, Water demand.

Water requirements for solar energy production are analyzed and compared with water consumption patterns for other fossil fuel types of electricity generation. Possible techniques include the use of mirrored surfaces and the photovoltaic approach where sunlight is converted directly to electricity using solar cells, the latter requiring no water. Economic feasibility and possible refinements of the solar cell are discussed. Wind generation is another solar-energy prospect with no water requirement. Geothermal energy has been used commercially only under geologic conditions where heat from the Earth's interior is transported to the surface by convective circulation of steam or very hot water. Natural hydrothermal systems may produce dry steam or, more often, superheated water which contains great quantities of thermal energy. Dry hot rock energy utilization is discussed as a system which may improve as energy is withdrawn from it. More air-cooled power plants may also be developed in the future. FEDERAL AND STATE GOVERNMENTS, AND THE INDIAN NATIONS: WATER RIGHTS, CONFLICTS, AND POLICIES,
In: Energy, Water, and the West, November 2-5, 1975, Albuquerque, p 21-34, May 1976. 5 append.

Descriptors: *Federal government, *State governments, *Indian reservations, *Federal-state water rights conflicts, *Water rights, Governmental interrelations, Water resources development, Water policy, Constraints, Jurisdiction, Land management, Energy, Planning.
Identifiers: *Western U.S.

The authority over water rights and water use policies belongs chiefly to the states, but federal government control and influence is increasing. State jurisdiction, interstate policy conflicts, and federal laws which affect surface water resources are discussed. The Bureau of Land Management has generally been concerned with small water developments for livestock, wildlife and watershed purposes, but its role has shifted somewhat toward general management of water resources in cooperation with state officials. The priority in federal water programs is energy rather than other uses such as agriculture. The quantity of water under government control could greatly expand through reserved rights and overcome state policy priorities. Federal-state conflicts in water resource law are discussed, including the issue of Indian lands water jurisdiction. The Supreme Court has consistently ruled that the authority to secure water rights to Indian tribes is contained in the Constitution; lands reserved under these provisions are protected by the Supremacy Clause and not subject to impairment by the states. Indian management of land and water resources is discussed. Cooperative water planning between state, federal and Indian governments is considered crucial. (See also W77-00542) (Jahns-Arizona)

INTERNATIONAL JOINT VENTURES IN FISHING AND 200-MILE ECONOMIC ZONES,
British Columbia Univ., Vancouver. Div. of International Business Studies.
J. W. C. Tomlinson, and I. Vertinsky.
Jounral of the Fisheries Research Board of Canada, Vol. 32, No. 12, p. 2569-2579, 1975. 1 tab., 50 ref.

Descriptors: *Marine fisheries, *Jurisdiction, *Participating funds, *Investment, Exploitation, Decision making, Africa, South America, Industries, Foreign countries.
Identifiers: *Joint fishing ventures, 200-mile zones, Sovereign waters, Foreign investment.

Various strategies that may be adopted by coastal nations for utilization of fishery resources under a system of 200-mile economic zones are examined. The benefits and problems that are likely to arise out of alternative approaches, such as a do-nothing strategy, independent operation, licensing, foreign subsidiaries, and joint ventures are discussed. A form of joint venture has the greatest potential for success in achieving both effective utilization of resources and beneficial development of the underdeveloped coastal nations. Because of the inputs of resources, technology, and access to markets by the foreign partner, the joint operation not only generates revenues, but the costs of developing the fishery are more than covered, thus avoiding or reducing the need for development subsidies. A joint operation provides a prescribed control and indirectly creates externalities favorable to related and dependent activities. A necessary condition of joint participation is the inclusion of local technical and managerial personnel to generate a skilled base in the host country. For those coastal nations lacking effective domestic naval policing ability, the growth of a fishing fleet generates the growth of a merchant marine capability as the base for an operational naval force. The institutionalization of joint ventures in fishing would also serve as a foundation to resolve problems during exploitation of sea-bed mineral resources. (Auen-Wisconsin)

spite nearly a decade of effort, progress wards agreement on a new Law of the Sea OS) Convention has been extremely slow. This per notes the diversity of perspectives among e participants, describes the basic issues, and ggests policy changes for the United States. The sdom of a purely conventional approach to the velopment of a new LOS is examined. It is sug-sted that a totally different approach, one which pragmatic and has its origins in customary law, needed. While there are many alternative ap-oaches to initiation of customary LOS evolu-nary processes, several recommendations are ade to demonstrate a new policy approach, in-ding: (1) proclamation of a 12-mile territorial a for the U. S.; (2) proclamation of a 200-mile onomic zone; (3) recognition of the archipelago nciple; (4) enactment of enabling legislation to rmit the commencement of undersea mining erations; (5) declaration of a national policy op-sing the dumping of hazardous materials in the ean; and (6) the obtaining of maximum freedom scientific research. kes and reservoirs are a major public resource. such, they require active management by a able legal authority. In some regions, federal or e agencies may best be able to assume the lead e. In regions with many lakes, a local unit may more appropriate. Through recent legislation, sconsin has provided a mechanism by which lo-ties can become responsible for their own es. Chapter 33 of the Wisconsin Statutes is the bling authority for such local control. Under apter 33, the state and federal governments will provide funds for such localities for lake and reservoir management. Furthermore, because of the state program, Wisconsin has managed to obtain a large share of federal allotment under the FWPCA Amendments of 1972. Chapter 33 became reality through the work of the Inland Lake Demonstration Project, which spent years educating the people of the state as to the need for such legislation. Hopefully other states will follow Wisconsin's lead. (Frank-Florida)

Toward the close of the 19th century, when a number of governments agreed that common navigational interests merited an international exchange of ideas, the Permanent International Association of Navigation Congress (PIANC) was formed. This article explains the organization, functions, and goals of PIANC. PIANC affords high level professionals, chosen for their diversity of training and experience, an opportunity to meet and exchange technical and professional information among national policy makers. PIANC actions are directed by a Permanent International Commission (PIC) appointed by the member governments. The quadrennial congresses are preceded by the publication of professional papers on subjects selected by the PIC. Five PIANC commissions are currently at work in the following areas: sports and pleasure navigation; waves; reception of large ships; locks, ship lifts and river weirs; and environmental effects of dredging and the disposal of dredged materials. DECISION TO LEASE OUTER CONTINENTAL SHELF LANDS,
Massachusetts Energy Policy Office, Boston.
H. Lee.
Coastal Zone Management Journal, Vol 2, No 1, p 31-46 (1975). 16 p, 31 ref.

Descriptors: *Continental shelf, *Mineral industry, *Decision making, *Oil fields, *Long-term planning, Short-term planning, Oil spills, Oil wells, Oil industry, Oil, Natural gas, Leases, Bids, Exploration, Exploitation, Geologic formations, Geological surveys, Offshore platforms, Coasts.
Identifiers: *Coastal waters.

The piecemeal process by which the United States is developing its offshore resources can be improved by greater cohesion in planning and development procedures. Currently each resource is usually considered in isolation. For example, one group of policy makers will be concerned with oil, another with fishing, and a third with pollution. The author suggests that the decision to lease areas of the Outer Continental Shelf for purposes of oil exploration was principally determined by the form of the decision making process, rather than by a rational analysis of economic and political factors. The author favors a plan put forth by Senator Hollings of South Carolina, which would do away with the piecemeal approach of leasing tract by tract. Instead, percentage shares of entire geological structures would be leased. No joint bidding would be allowed. A party could bid up to 20% of the total interest in that structure. Bids would be awarded on the highest dollar value per one percent interest. Combined geologic studies would enable the coastal states to assess the impact of drilling on the basis of hard information. As a result coastal states would have the chance to establish management structures necessary to protect their existing economic and environmental resources. (Frank-Florida)

SHORELINE EROSION: IMPLICATIONS FOR PUBLIC RIGHTS AND PRIVATE OWNERSHIP,
P. Burka.
Coastal Zone Management Journal, Vol 1, No 2, p 175-195 (1974). 21 p, 93 ref.

Descriptors: *Public rights, *Erosion control, *Beach erosion, *Shore protection, *Public access, Public benefits, Public lands, High water mark, Erosion, Common law, Civil law, Easements, Prescriptive rights, Water law, Shores, Beaches, Legal aspects.

Public beach access rights and the erosion of the ocean shoreline have each been identified as major coastal zone problem areas. There is a close relationship between the two. Suggested here are certain concepts that should be universally adopted to make beach regulation more coherent and cohesive. Different states have different theories concerning public beach access rights. They range from public ownership from the mean high tide line all the way up to the vegetation line. Where erosion of the shoreline is concerned, there are problems in determining what actions one landowner may take to protect his beach since his actions may result in damage to an adjacent landowner. Some states say that one may protect one's land, but not at the expense of adjacent landowners. Others follow the Common Enemy doctrine, which allows greater latitude in protection even at another's expense. The erosion problem presents another question. Under what theory does the public have a right to prevent erosion, and to what land does the public have a right when erosion occurs. The author answers these questions by calling for the adoption of the concept of a 'rolling easement'. Any universal concept concerning beach law, however, is far from a reality. (Frank-Florida)

TRAIN V COLORADO PUBLIC INTEREST RESEARCH GROUP, INC. (CONFLICT OF FEDERAL WATER POLLUTION CONTROL ACT AND THE ATOMIC ENERGY ACT).
96 SCt 1938-49 (1976). 10 p.

Descriptors: *Radioactive wastes, *Water quality standards, *Jurisdiction, *Permits, *Federal Water Pollution Control Act, Navigable waters, Pollutants, Judicial decisions, Administrative agencies, Governmental interrelations, Nuclear powerplants, Radioisotopes, Nuclear wastes, Federal government, Regulation, Standards, Water pollution, Legislation.
Identifiers: Licenses.

Plaintiff organization brought suit to compel defendant federal agency to control the discharge into navigable waters of radioactive effluents from two nuclear power plants. Plaintiff contended that the defendant had a non-discretionary duty under the Federal Water Pollution Control Act (FWPCA) to control such discharge and that the defendant failed to perform said duty. The defendant asserted that the authority to regulate discharge of radioactive materials lay wholly with the Atomic Energy Commission (AEC). The trial court granted summary judgement for the defendant. The appellate court reversed. The Supreme Court of the United States held for the defendant, finding that the defendant's determination that source, by-product, and special nuclear materials were not 'pollutants' within the meaning of the FWPCA. The Court determined that the legislative intent was that the FWPCA permit program cover only those materials beyond AEC juristiction, such as radium and accelerator produced isotopes. The Court also determined that the AEC retains full authority to regulate materials covered by the Atomic Energy Act to the exclusion of any other agency. (Capehart-Florida)

Descriptors: *Wyoming, *Interstate compacts, *Equitable apportionment, *Surface-groundwater relationship, *State governments, Surface waters, Groundwater, Nebraska, Data collections, Regulation, Governmental interrelations, Gaging stations, Reservoirs, Diversions, Surveys, Beneficial use, Interstate rivers, Irrigation, Surface water availability, Water supply, Water resources, Groundwater resources.
Identifiers: *Upper Niobrara River Compact(Wyo-Neb).

The Upper Niobrara River Compact, a compact between Wyoming and Nebraska, has been ratified by the state of Wyoming. The compact governs apportionment between the states of the surface water supply of the river basin. The compact specifies the limitations on use of surface waters to be imposed on Wyoming as the upstream state. It further provides for a study of the groundwater flow since use of groundwater in the basin may deplete the surface flow in the river. Apportionment of the groundwater maybe done later by supplementing the compact. If, as a result of the study, groundwater apportionment is not deemed necessary, further analyses shall be required at two-year intervals until such apportionment is made. (Capehart-Florida)

The state of Wyoming prohibits the pollution or impairment of the purity and usefulness of the waters of any spring, reservoir, stream, irrigation ditch, lake or other water supply (surface or subterrarean) if those waters are used wholly or partly as a source of public or domestic water supply. The following causes of water impairment are specifically prohibited: depositing or placing the carcass of any dead animal, or the offal or refuse matter from any slaughter house, meat market or the like; depositing any spoiled meats or fish, or any animal or vegetable matter in a putrid or decayed condition; and depositing any refuse or garbage or offensive matter. An exception to this latter prohibition is made for municipal sewage and garbage disposal systems. The throwing or placing of sawdust from a sawmill into any river, stream, creek, bay, pond, lake, canal, ditch or other water course is specifically proscribed. (Cowart-Florida)

aspects, Aquiculture, Shellfish farming, Beach
Shores, Public rights, State governments, Legi
tion, Constitutional law, Judicial decisions, E
water mark.
Identifiers: Public trust doctrine.

Plaintiff state of Georgia brought suit against
fendant landowners to determine the ownershi
the foreshore and of the land accreted above
high water mark. In 1902 the high water mark
judicially determined to be the boundary for oc
front property. The legislature then enacte
statute to extend the boundary to the low w
mark, reserving certain rights of navigation to

blic. The statute was ratified by the 1945 con-
tution. The state contended that such ratifica-
n was ineffective and the original statute uncon-
tutional. The Supreme Court of Georgia held
t the 1902 act was constitutional; however, the
fect of the act was to vest fee simple title to the
reshore in the state with the exclusive right to
nt, cultivate, and harvest oysters and clams
thin the foreshore area reserved to the adjacent
downers. Addressing the issue of ownership of
d accreted from navigable tidewaters, the court
ld that such lands accrue to the adjacent lan-
wner. Two dissenting justices felt that the 1902
t set the seaward boundary at the low water
rk. (Capehart-Florida)

n of flow, Judicial decisions.

intiff landowner sought to recover compensa-
n from defendant city for flood damage. The
intiff owned property through which a small
ek flowed and which was downstream from the
y's drain culverts. The plaintiff installed 24 in.
d 36 in. drainage pipes to contain the creek
ters and permit construction of buildings on the
perty. In 1960, the city replaced its original 30
pipes with 42 in. pipes. After this, the plaintiff
perienced flooding problems caused by
ckage of his pipes with large debris. The plain-
f contended that the city had a duty to install
otective devices to prevent debris from blocking
pipes. The trial court directed a verdict for the
fendant. The Court of Appeals of North
rolina affirmed, holding that the defendant had
ed properly in that it had only accelerated the
lume and flow of water in the stream and had
t diverted the course of the creek. The court
ted that liability would not be imposed on the
fendant simply because the plaintiff's drainage
stem was inadequate to handle the increased
w caused by the defendant's larger drain pipes.

intiff occupants of a building that was flooded
ght compensation from defendant city for
ter damage to the contents of the building.
thin a one-month period plaintiffs' warehouse
a was flooded twice; first to a height of 19
hes, then to 28 inches. The building was located
ectly over a storm sewer which had been con-
ucted by the city along the course of a creek.
intiffs contended that the defendant was
ligent in failing to provide a storm sewer of suf-
ent size to handle the storm waters. The Court
Civil Appeals of Texas, affirming the verdict
the defendant, held that the city had no legal
ponsibility to maintain adequate drains. Stating that partial protection is better than none, the court said that the magnitude of flood protection provided is within the discretion of the city. Although a city may not increase the flow of surface waters across land, it has no duty to prevent all flooding caused by the natural drainage patterns of the watershed. (Capehart-Florida)
W77-00995

GARDNER V HAMILTON (RIGHT TO EXERCISE EMINENT DOMAIN FOR FLOOD CONTROL).
536 SW2d 422-25 (Tex Ct Civ App 1976). 4 p.

Descriptors: *Texas, *Eminent domain, *Easements, *Flood control, *Condemnation, Legislation, Legal aspects, Flood protection, Land tenure, Strucutes, Control, Water control, Cities, Water conservation, Judicial decisions.
Identifiers: Injunctive relief.

Plaintiff landowners sought to vacate an easement on 5.9 acres of their 7.77 acre tract granted by them to defendant city for flood control purposes. The plaintiffs further sought to enjoin construction of a water conservation structure on their property. The city filed a cross action to declare the easement valid or alternatively to condemn the property. The trial court set aside the easement and gave title to 5.68 acres to the city under eminent domain, requiring payment of $9806. The plaintiffs appealed, contending that the city did not have the power of eminent domain for the purpose of flood control and further contending that the proper procedures for condemnation had not been followed. The Court of Civil Appeals of Texas affirmed the trial court decision. The court held that flood control and water retention are proper purposes for the exercise of eminent domain. Furthermore, when the title to land is in dispute, the condemnor is not required to follow the same procedure as in an initial condemnation proceeding. (Capehart-Florida)
W77-00996

MC CLELLAN V JANTZEN (STOCKING OF FISH NOT AN ACT OF APPROPRIATION GIVING VESTED RIGHT IN WATER STOCKED).
547 P2d 494-97 (Ariz Ct App 1976). 4 p.

Descriptors: *Lakes, *Arizona, *Judicial decisions, *Prior appropriation, *Fish, *Stocking, Water users, Water rights, Dams, Reservoirs, Water resources, State governments, Drainage effects, Drainage.

Plaintiff was a prior appropriator of water from an aritificial lake who sought an injunction to stop the stocking of fish therein by defendant State Game and Fish Department. The legal issue was whether the act of stocking the reservoir with fish would constitute an act of appropriation requiring a permit from the State Land Department. While the appropriation of water for fish was added to the Arizona statutory body in 1962, the act of stocking fish was never intended to constitute an appropriation of that water. Rather, the statute gives the Department the authority to stock fish without appropriating of any water. Furthermore, the State Game and Fish Department contended that unappropriated waters existed in the lake. The court refused to rule on this question, however, saying instead that it was a matter for the State Land Department. It was conceivable, should no unappropriated water be found, that the lake owner could drain the lake and thus kill all the stocked fish. In that event, said the court, there would be no cause of action against him. In short, given an adverse ruling by the State Land Department, the Game and Fish Department was taking its chances by stocking the lake. (Frank-Florida)
W77-00997

SALT RIVER VALLEY WATER USERS' ASSOCIATION V GIGLIO (DUTY OF REASONABLE CARE IN DISPOSING OF FLOODWATERS ENTERING CANAL SYSTEM).
549 P2d 162-76 (Ariz 1976). 15 p.

Descriptors: *Flood routing, *Floodways, *Judicial decisions, *Canals, *Bridge design, Flood protection, Flood damage, Flood control, Flood discharge, Legal aspects, Negligence, Drainage, Drainage area, Drainage systems, Damages, Bridges, *Arizona, *Water users.
Identifiers: Salt River Valley Water Users' Assoc.

Plaintiff homeowners brought an action against the Salt River Valley Water Users' Association to recover compensatory and punitive damages for flooding of their property due to breaches in an irrigation canal operated by the association. After a 1.1 million dollar jury verdict, the defendant Association appealed to the Arizona Supreme Court, claiming that the evidence was insufficient to support a jury finding of negligence and that punitive damages were unwarranted. After reviewing the trial transcript, the Supreme Court ruled that the evidence was sufficient. The court found that several available waterways were not opened in time to relieve pressure caused by the increased water flow, and that a bridge was constructed so low so as to force the water into increased velocity to pass under it. Although not absolutely liable, the Association did owe a reasonable duty of care to those under its protection; further, a jury could have found that this care was not exercised. The fact that plaintiffs constructed their homes on a noted drainage tract was held insufficient to bar an action for recovery. Punitive damages, however, were denied because of a lack of wanton, malicious or oppressive conduct. (Frank-Florida)
W77-00998

GOWING V MC CANDLESS (CROP DAMAGE RESULTING FROM FLOODING OF OBSTRUCTED WATERCOURSE).
547 P2d 338-44 (Kan 1976). 7 p.

Descriptors: *Kansas, *Legal review, *Flood damage, *Ditches, *Timber piles, Damages, Judicial decisions, Crops, Overflow, Flood flow, Floods, Banks, Water levels, Water control.
Identifiers: Statute of Limitations.

Plaintiff landowners brought an action to recover for crop damage caused by water overflow stemming from an alleged obstruction of a watercourse by defendant lower landowners. During timber-clearing operations, the defendants obstructed a natural ditch with trees and dirt which prevented the drainage of land, thus damaging plaintiffs' crops. After the trial court found for the plaintiffs, the defendants appealed, contending that the action had not been brought within the applicable two year statute of limitations. The Kansas Supreme Court held that where an injury or wrong is classified as not original or permanent, but as temporary, transient or recurring, each injury causes a new cause of action to accrue, at least until the injury becomes permanent. Since the crop damage occurred every year for a period of years, and evidence had been introduced showing that the obstructions could have been removed at any time, the court ruled that the injury was temporary and recurring. Therefore, in the absence of permanent damages, the action claiming crop damages did not have to be brought within the two year statute of limitations, and was timely filed. The original verdict for damages was upheld. (Frank-Florida)

Descriptors: *Wyoming, *Water districts, *Watershed management, *Local governments, *Watersheds(Basins), Erosion, Flood protection, Sedimentation, Water storage, Water conserva-

tion, Water utilization, Water resources, State governments, Legislation, Real property, Eminent domain, Structures, Bond issues, Appraisals, Water resources development.
Identifiers: Public hearings.

Watershed improvement districts may be formed in Wyoming to prevent and control erosion, floodwater, and sedimentation damages and to store, conserve, develop, utilize and dispose of water so as to protect land and water resources. Watershed improvement districts may be formed as sub-districts of a soil and water conservation district. They may also be located in more than one soil and water conservation district. Public hearings on the feasibility of establishing a proposed watershed improvement district are required, followed by a referendum within the proposed district. Additional territory may be added to an existing district without a referendum if there are less than ten landowners involved. The board of directors of a district shall have the power to: levy and collect assessments for special benefits; acquire and sell real or personal property; condemn private property through eminent domain; and, construct and operate any necessary structures. LAKE WASHINGTON SHIP CANAL,
Wash Rev Code Ann sec 37.08.240 (1964).

Descriptors: *Washington, *Legal aspects, *Federal government, *Canal construction, *Canals, Canal design, Construction, Transportation, Ships, Damages, Channels, Channeling, Conduits, Excavation, United States, Spillways.
Identifiers: *Puget Sound(Wash), *Lake Washington Ship Canal(Wash).

The Federal government was planning to construct a connecting canal between Lake Union, Lake Washington and Puget Sound in the state of Washington. This Washington legislation granted the United States the right to build and operate the Lake Washington ship canal along with the necessary spillways, buildings, power plants and landways. It also granted the right to lower the waters of Lake Washington and raise the level of Salmon Bay. The United States was released from all liability to damages to this state that could arise from the lowering or raising of the waters. (Frank-Florida)

1971 WATER RESOURCES ACT.
Wash Rev Code Ann secs 90.54.010 thru 90.54.070 (1975).

Descriptors: *Water resources, *Legislation, Data collections, Beneficial use, Water allocation(Policy), Water utilization, Waste water disposal, Data storage and retrieval, Ecology, *State governments, Base flow, Rivers, Streams, Fish, Wildlife conservation, Impoundments, *Washington.

The Washington legislature adopted the following broad guidelines as part of its 1971 Water Resources Act: (1) uses of water for statutorily specified purposes are considered beneficial; (2) allocation of water among potential users shall be based on the securing of maximum net benefits for the people of the state; (3) all rivers and streams shall retain base flows necessary to provide for fish and wildlife preservation; (4) all reasonable and presently available methods of treatment shall be used prior to waste water entry; (5) multiple-purpose impoundment structures are to be preferred over single purpose structures; and (6) water management programs are deemed to be in the public interest. Furthermore, a water resources archive shall be established and maintained by the department of ecology to organize, collect and develop data and studies pertaining to water and related resources. (Frank-Florida)

SHORELAND BOUNDARIES.
Wash Rev Code Ann secs 79.16.380, .419 thru .430, and .510 (1962).

Descriptors: *Legislation, *Washington, *Navigable waters, *Boundaries(Property), *Beds under water, Excavation, Locks, Gates, Shores, Construction, Canal construction, Dredging, Water utilization, Beds, Legal aspects, State governments.
Identifiers: *Fill permits.

The state of Washington has enacted legislation providing that when land is sold by the state that is adjacent to navigable waters, and the boundary is not defined, the water boundary shall be the line of ordinary navigation in such water. Where the water level is lowered either by state or federal action, the new water boundary shall be the line of ordinary navigation found in such waters after the lowering. This statute also reserves for public use all shorelands and the bed of Lake Washington, and it states specific boundaries. Where excavation of waterways is concerned, the commissioner of public lands may enter into contract with any person or company for the filling in and raising of shore lands. The governor must approve any such contract, and the restrictions on what lands shall be affected by this statute are listed. All waterways so excavated shall be public waterways, free to all citizens, with the exception of necessary tide gates or lock, the operation of which may be paid for by toll. (Frank-Florida)

APPROPRIATION.
Utah Code Ann secs 73-3-1, 73-3-19 thru -23 (1968).

Descriptors: *Utah, *Appropriation, *Water allocation(Policy), *Beneficial use, *Priorities, Legal aspects, Water utilization, Water rights, Water quality, Regulation, Water quality control, Jurisdiction, Damages, Distribution, Diversion, Diversion losses, Impounded waters, Prior appropriation.
Identifiers: Public waters, Right of entry.

Rights to the use of unappropriated public waters in Utah may be acquired by applying to the state engineer. The appropriation must be for some useful and beneficial purpose. Furthermore, whenever an applicant must enter private property to survey or secure information for making a water filing and is refused right of entry, he may petition the district court for an order granting such right. An applicant may also divert appropriated waters into natural streams and impound them after acquiring the approval of the state engineer. Specific regulations concern the quantity, quality and expenses involved in such appropriation. Appropriators shall have priority among themselves according to the dates of their respective appropriations. Other provisions govern the replacement of underground water by any junior appropriator whose appropriation may diminish the quantity or injuriously affect the quality of appropriated underground water in which the right to the use thereof has been established by law. (Lauer-Florida)

NAVIGATION LAW, SECTION 89-B.
1973 Op Att'y Gen New York 18-22. 5 p.

Descriptors: *New York, *Navigable waters, *State jurisdiction, *Judicial decisions, Ships, Political aspects, Regulation, Legal aspects, Riparian rights, Navigation, Bodies of water, Law of the sea, Water policy, Water rights, Federal jurisdiction, Reservation doctrine, Control, Legislation, Operations, Permits, Coasts.
Identifiers: *Licenses, Administrative regulations, Coastal waters, Coastal zone management.

The New York Navigation Law provides that foreign flag vessels and American vessels under registry, that is, engaged in foreign trade, which transit state territorial waters are subject to state pilotage laws. Such laws are not applicable to American vessels engaged in the domestic coasting trade. Decisions of the U.S. Supreme Court are discussed which hold that one having a federal pilot's license is not thereby qualified to navigate a foreign flag vessel or an American vessel under registry in state waters regulated by state pilotage laws. UNAPPROPRIATED WATER IN UNDERGROUND WATER BASIN.
1973 Rep of New Mex Att'y Gen 38-9. 2 p.

Descriptors: *New Mexico, *Water conservation, *Water management(Applied), *Water allocation(Policy), Water distribution(Policy), Competing uses, Equitable apportionment, Water demand, Water utilization, Control, Regulation, Water rights, Reservoir operation, Water resources, Well permits, Water policy, Permits, Subsurface waters, Groundwater availability, Groundwater basins.
Identifiers: Water rights(Non-riparians), Administrative regulations, Licenses.

In an underground basin or reservoir with reasonably ascertainable boundaries, the State Engineer may not authorize a new water use appropriation unless unappropriated water exists or the proposed appropriation involves a non-consumptive use which will not impair existing rights. Under present law the State Engineer must determine whether unappropriated water exists on a case by case basis. The burden is upon the applicant to demonstrate that unappropriated water exists or that no impairment of existing rights will be caused. Even though no unappropriated water exists, an application for a new appropriation must nevertheless be approved provided it involves a non-consumptive use of water; that is, one that causes no net depletion of water in a reservoir and therefore does not impair existing rights. (Reinders-Florida)

MARINE RESOURCES COMMISSION--OYSTER GROUNDS--USE OF SUBAQUEOUS LANDS FOR CONSTRUCTION AND MAINTENANCE OF SEWAGE DISPOSAL FACILITIES.
1973-1974 Op Att'y Gen Va 236-37. 2 p.

Descriptors: *Virginia, *Sewage systems, *Oysters, *Shellfish farming, *Public lands, Public rights, Constitutional law, Sewage districts, Governments, Legal aspects, Sanitary engineering, Sewage disposal, Water law, Public utilities, Public works, Construction, Shallow water, Water types, Beds under water.
Identifiers: Water rights(Non-riparians), Public trust doctrine, Subaqueous lands, Oyster beds.

The Virginia Constitution provides that natural oyster beds in commonwealth waters are to be held in trust for the people of the state. This section does not prohibit the legislature from authorizing the use of tidal waters for any public purpose. Subaqueous lands may be used for the construction and maintenance of sewage disposal facilities. Broad authorization was given to the Hampton Roads Sanitation District Commission for the use of any state subaqueous lands. This authorization is construed to encompass lands held under private leases from the state, subject to the compensation requirement of the Fifth Amendment. (Reinders-Florida)
W77-01015

O'BRIEN V BARNES BUILDING COMPANY (DEFINITION OF TIDAL WETLANDS).
380 NYS2d 405-29 (Sup Ct 1974). 25 p.

Descriptors: *New York, *Wetlands, *Tidal waters, *Jurisdiction, *Judicial decisions, State governments, Delaware, Rhode Island, Maryland, Construction, Tides, Salinity, Administrative decisions, Storm surge, Legal aspects, Coasts.
Identifiers: *Coastal zone management, *Coastal waters, *Coastal Zone Management Act.

Plaintiff individuals and conservation group brought an action seeking an injunction to prevent defendant developers from constructing a housing development since an adjacent pond and the land surrounding it were protected tidal wetlands under

the Tidal Wetlands Act. At the heart of the suit was the interpretation of the New York statutory phrase 'areas now or formerly connected to tidal waters'. Although the phrase had not received judicial interpretation by New York courts, the plaintiffs maintained that there was no implied time limitation on the word 'formerly'. In support of their contention, the plaintiffs cited Delaware statute that defined wetlands as including areas which now or in this century have been connected to tidal waters. The court noted that the Delaware definition was in the minority, and looked to other criteria to determine the status of the water body. Under the Rhode Island and Maine statutes, which were found to represent the majority view, wetland use and susceptibility to storm flowage respectively are determinative of wetlands status. Under these statutes, the pond and the adjacent land did not qualify as wetlands. The court also noted that the pond would not be granted wetland status under the federal Coastal Zone Management Act, which uses salinity as the sole criterion in determining areas within its jurisdiction. Thus, the court found for the defendants and removed the restraining order although it did not bar a later action for an injunction on the grounds of possible environmental damage. (Frank-Florida)

IDAHO WATER RESOURCE BOARD V KRAMER (STATUTORY INTERPRETATION OF WATER RESOURCES BOARD COMPREHENSIVE STATE WATER PLANNING).
548 P2d 35-72 (Idaho 1976). 38 p.

Descriptors: *Idaho, *State governments, *Judicial decisions, *Water resources development, Permits, Constitutional law, Water use, Dams, Dam construction, Water supply, Water supply development, Construction, Legal aspects.

Appellant Secretary of the Idaho Water Resource Board sought dismissal of a writ of mandamus forcing him to approve an application made by respondent Board to the Federal Power Commission for a power licence. In upholding the issuance of the writ, the Idaho Supreme Court made the following findings of fact: (1) where hearings were required by the Water Resources Board in 'affected areas', that meant only those areas subject to the most immediate and direct impact of any project proposal; (2) an overall water resource plan need not be adopted in one complete act, but rather may be done in stages; (3) development and conversation of water resources is a public purpose within the meaning of the state's due process clause; and (4) this proposed joint undertaking between the Board and a private power company involved dam construction, and was not arbitrary or unreasonable. The court further ruled that the very essence of the project was to maximize the use of water, and thus, upheld the mandate over the numerous substantive and procedural objections made by the Secretary. (Frank-Florida)

WATERS--FISH AND GAME--DEPOSIT OF PESTICIDES IN PUBLIC WATERS.
1973 Op Att'y Gen Wisconsin 130-32. 3 p.

Descriptors: *Wisconsin, *Pesticides, *Fishkill, *Water law, *Penalties(Legal), Water pollution effects, Legislation, Pollutants, Toxins, Water pollution, Control, Constitutional law, State jurisdiction, Negligence, Legal aspects, Water pollution sources, Pesticide toxicity, Hazards, Water quality control, Chemical wastes.
Identifiers: Administrative regulations.

Wisconsin state law authorizes the Department of Agriculture to adopt rules governing the use and formulation of pesticides, and to determine the time and means of their application. The Attorney General of Wisconsin has determined that prosecution for violation of such rules is not barred by a civil action brought to recover statutory damages for the killing of fish allowed under a separate statute. Prosecution under both sections is permissible since different elements must be proven in each case. Prosecution for violation of more than one statute, arising from a single occurrance or chain of events, is not unusual and enjoys statutory sanction in Wisconsin. (Reinders-Florida)

RESERVE MINING CO V CITY OF DULUTH (FILTRATION OF LAKE SUPERIOR BY CORPS OF ENGINEERS).
529 F2d 181-89 (8th Cir 1976). 9 p.

Descriptors: *Potable water, *Filtration, *Domestic water, *Industrial wastes, *Lake Superior, Jurisdiction, Federal government, Mining, Legal review, Judicial decisions, Administrative agencies, Public health, costs, Water pollution, Mineral industry, Cities, Municipal water, Water purification, Mine wastes, Water quality, Treatment, Great Lakes, Lakes, *Minnesota.
Identifiers: Carcinogens, Taconite.

Appellant mining company sought relief from a district court order requiring the appellant to pay $100,000 to appellee city to provide for filtration of the city's water supply. The Eight Circuit Court of Appeals dissolved the order because of a lack of procedural due process and remanded the case to the district court for a proper determination of the costs of filtration to be charged to the appellant. The Corps of Engineers, under a district court order to provide filtered drinking water to the communities on Lake Superior because of the imminent health hazard caused by appellant's discharge of taconite tailings, sought to shift this responsibility to local officials. The Court of Appeals recognized a responsibility for local governmental cooperation but said continued federal supervision was required because of the following factors: (1) federal jurisdiction over Lake Superior; (2) pollution affecting several states; (3) legal action initiated by the federal government; (4) technical knowledge possessed by federal agencies; and (5) lack of expertise by local governments. (Capehart-Florida)

CIRCLE INVESTMENT CO V CITY OF TOLEDO (EFFECT OF CHANGING CANAL TO LIMITED ACCESS HIGHWAY ON ABUTTING LANDOWNERS--NO ACCESS REQUIRED).
345 NE2d 442-48 (Ohio Ct App 1975). 7 p.

Descriptors: *Ohio, *Highways, *Canals, *Public access, *Access routes, Boundaries(Property), Land tenure, Real property, State governments, Cities, Right-of-way, Judicial decisions, Canal embankments, Banks, Beds, Legal aspects, Roads, Transportation, Inland waterways, Lake Erie.

Plaintiff investment company brought suit against defendant city for a declaratory judgment proclaiming the existance of a right of way from a limited access highway to a tract of land owned by the plaintiff. The plaintiff's property was bounded on three sides by a turnpike and two railroad lines. The only physical access available was from the limited access highway on the fourth side. The limited access highway was located on land formerly occupied by the bed, banks, and towpath of a canal. The city had acquired fee simple title to the canal property by purchase from the state. The plaintiff contended that he had a right of access to the highway by virtue of a right of access to the canal. The trial court found for the defendant city and the Court of Appeals of Ohio affirmed, holding that the right of access of ownership of land abutting the canal was no greater than the public right of access; furthermore, that the change of use from a canal to a highway did not create new rights in abutting owners. The court also held that abandonment of the canal by the state did not cause the title to revert to the grantor since the interest was in fee simple. (Capehart-Florida)
W77-01044

LOUISIANA ENVIRONMENTAL SOCIETY V BRINEGAR (ENVIRONMENTAL IMPACT STATEMENT AS TO ARTIFICIAL LAKE TO BE BRIDGED BY HIGHWAY CONSTRUCTION).
407 F Supp 1309-26 (WD La 1976). 18 p.

Descriptors: *Artificial lakes, *Louisiana, *Highway relocation, *Public rights, *Bridges, Engineering structures, Water policy, Water law, Bridge construction, Judicial decisions, Legal aspects, State governments, Construction, Planning, Road construction, Economics, Environmental effects, Civil engineering, Highways, Highway effects.
Identifiers: Injunctive relief, Environmental impact statements.

Plaintiff environmental society requested an injunction to halt bridging of an artificial lake for construction of an interstate highway bypass. The U.S. District Court held that the Secretary of Transportation acted within his authority in determining that, although alternate routes were feasible, only the adopted route was prudent. The Secretary could reasonably have believed that unusual factors were present or that alternatives involved problems of extraordinary magnitude. A subsequent amendment requiring public hearings on social and environmental effects would not be required since environmental aspects had been considered in depth. Furthermore, a new drainage system incorporated into the bridge did not require a new hearing. (Reinders-Florida)

MID-SHIAWASSEE COUNTY CONCERNED CITIZENS V TRAIN (ENVIRONMENTAL IMPACT AS TO A PHYSICAL-CHEMICAL MODE OF TREATMENT FOR A WASTE-WATER TREATMENT PLANT).
408 F Supp 650-60 (ED Mich, SD 1976). 11 p.

Descriptors: *Michigan, *Judicial decision, *Decision making, *Waste water treatment, *Administrative decisions, Water policy, Grants, Projects, Water rights, Adjudication procedure, Sanitary engineering, Legislation, Intergovernmental relations, Administration, Sewage treatment, Waste water disposal, Water law, Planning, Permits, Control, Legal aspects.
Identifiers: *Environmental Impact Statement, *National Environmental Policy Act, Administrative regulations, Comparative law.

A citizen's group brought suit to compel state officials to comply with the National Environment Policy Act. The officials had approved federal and state grant assistance for construction of a physical-chemical wastewater treatment facility within the city of Owosso, Michigan. The court granted the defendants' motion to dismiss the complaint holding that where a federal agency concludes an environmental impact statement is not necessary that agency must issue a negative declaration supported by a 'mini' EIS or an environmental impact appraisal. The determination that an EIS is not necessary is subject only to an arbitrary or capricious standard of review. Thus a court will not rule on the relative merits of competing scientific opinion where the sufficiency of an EIS statement is an issue. (Reinders-Florida)

ER ZONING - TOOL FOR GROUND-
ER BASIN MANAGERS,
gical Survey, Denver, Colo.
Dutcher, and L. R. Peterson.
nd Water, Vol. 13, No. 5, p 395-399, Sep-
er-October 1975. 5 ref.

riptors: *Groundwater, *Groundwater availa-
, *Groundwater basins, *Groundwater
rces, *Water zoning, Water conservation.

r zoning is not new in arid areas. Many States
laws limiting pumping. However, most of the
ng ordinances do not achieve their stated
se. Many enforce conservation of scarce
rces for benefit of future users. Some pur-
o ensure a continuous water supply to the
holders. Existing ordinances that limit
ing to the so-called safe yield do not take
or recoverable benefits into consideration,
ne period of use is not stipulated. Therefore,
pumping is regulated under such or-
ces, the basins cannot be managed to obtain
num benefits to present users of the available
y. Two types of ordinances are discussed:
al-purpose and management-plan or-
ces, which are designed to make possible the
vement of specific objectives. Examples are
of how the latter can be designed to: limit
n depletion and protect existing rights;
se pumping to increase economic return;
conjunctive use of all land, mineral, and
resources; and establish production quotas
ure optimum economic return to all users
a predetermined period. (Skogerboe-Colo

THE PARTICIPATION OF NEW YORK COMMUNITIES IN THE FEDERAL FLOOD INSURANCE PROGRAM,
Cornell Univ. Agricultural Experiment Station, Ithaca, N.Y. Dept. of Rural Sociology.
D. E. Moore, and R. L. Cantrell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 550, Price codes: A02 in paper copy, A01 in microfiche. Cornell Community and Resource Development Series, Bulletin 11, March 1976. 25 p., 1 fig., 7 tab., 20 ref. OWRT A-057-NY(1), 14-31-0001-5032.

Descriptors: *Flood insurance, *Land use, *Community development, Zoning, Building codes, *National Flood Insurance Act, Decision making, *New York, *Social participation.
Identifiers: Flood hazards, Community structure, *Community participation.

The Federal Flood Insurance Program requires that individual communities pass a land use law aimed at reducing flood losses before individuals in their respective communities can purchase flood insurance. Some communities with flood hazard areas have responded with varying rates of speed, while others have not responded at all. By July 1, 1975, more than one-third of the 745 New York communities threatened with federal sanctions had failed to act. This research develops a model to predict whether or not communities will adopt the program and their speed of adoption. The theoretical concepts employed are community differentiation, community centrality, and program need. These variables are operationalized using the presence or absence of a zoning ordinance, whether or not the community subscribes to the New York State Building Code, recent experience with flooding, and regional location in New York State. Each of these variables is positively and independently related to program adoption, speed of adoption, and whether the community initiates the action to participate or acts in response to federal notification. The findings are consistent with other studies of community innovation and change. Policy implications of the findings are discussed.

A REGIONAL PLANNING APPROACH TO THE FLOODPLAIN MANAGEMENT PROBLEM,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
R. N. Weisz, and J. C. Day.
Annals of Regional Science, Vol. IX, No. 3, p. 80-92, 1975.

Descriptors: *Flood protection, *Watershed management, *Integrated control measures, *Comprehensive planning, *Mathematical models, *Economic efficiency, Land use, Engineering structures, Optimization, Flood plain zoning, Building codes, Flood control, Economic rent, Arizona, Linear programming.
Identifiers: *Floodplain Management System, Pima County(Ariz).

The Floodplain Management System model (FMS) establishes a framework whereby land use and engineering methods can be combined and evaluated on a common basis to arrive at the most economically efficient flood protection solution. The model also permits identification of desirable combinations of land use and engineering works. It was tested in application to Pima County, Arizona, by considering the following alternatives: (1) Land use regulations (spatial and temporal distribution of urban land uses, site elevation through dirt fill, and floodproofing); (2) development policies (public acquisition of undeveloped land for open space, and public acquisition and removal of existing improvements from the floodplain); (3) engineering measures (dams, channel improvements). The plan formulation method is simple and straight-forward. For each possible development policy-engineering measure(s), the influence of public investment on the object row coefficients of all linear programmed land use activities is determined; the potential land use activities are screened so that only those containing economically efficient combinations of fill and floodproofing enter the LP model; the amount of land resource that is available in each location for LP land use assignments is computed; other appropriate constraints are determined, and the LP model is run. Economic rent is used to quantify the impact of each FMS mixture of means for attaining management objectives. (Auen-Wisconsin)

A TALE OF TWO CITIES: FLOOD HISTORY AND THE PROPHETIC PAST OF RAPID CITY,
Waikato Univ., Hamilton (New Zealand).
N. J. Ericksen.
Economic Geography, Vol. 51, No. 4, p. 305-320, 1975. 3 fig., 1 tab., 42 ref. NSF GI-32942.

Descriptors: *Flood protection, *Flood control, *Integrated control measures, *Decision making, Flood pin zoning, Future planning(Projected), Flood damage, Attitudes, *South Dakota.
Identifiers: *Rapid City(SD), Scenario analysis.

To demonstrate how new flood policies may ameliorate damage, the history of flood plain management in Rapid City is given starting from the response to its flood problem and ending with the disastrous flood of June 9, 1972. A scenario then posits what could have happened had various methods for reducing flood losses been adopted. Although the focus is on the impediments to the development of a sound flood plain management for that city it is applicable to the problems that face flood-prone communities in the over-reliance upon single engineering solutions; the lack of an integrated, multi-adjustment approach; the unawareness of constraints on the adoption of various adjustments; the inadequacy of traditional methods for evaluating adjustments; and the relevance of scenario analysis for the community decision-maker. The schism between what happened and what could have happened and what could have happened underscores the necessity for an approach that incorporates a broad range of adjustments into an integrated whole. The project evaluations conducted by federal agencies in Rapid City are at such variance with the actual outcome that the assumptions used in the various benefit-cost analyses, if not the mode of analysis itself, are questionable. A series of post-audit evaluations should be considered in selected flood-prone cities to thoroughly review the methodological procedures which denied Rapid City an adequate flood plain management program. (Auen-Wisconsin)

PLANNING FOR STORM WATER MANAGEMENT,
Watkins (G. Reynolds) Consulting Engineers, Inc., Lexington, Ky.
W. H. Qualls.
Public Works, Vol. 10, No. 1, p 43-47, January 1976. 2 fig, 1 tab.

Descriptors: *Kentucky, *Storm runoff, *Nonstructural alternatives, *Storm water, *Drainage basins, *Flood plain insurance, *Flood plains, *Flood plain zoning, *Detention reservoirs, *Flood control, Flood discharge, Flood protection, Floods, Flooding, Storms.
Identifiers: *Storm Water Management Plan, Wilmore(KY).

The Storm Water Management Plan is a 3 part program addressing the multiple needs of storm water

protection within a short and long-range context in the town of Wilmore, KY. The old solution was to build more storm sewers which would only push the problem downstream. It did not provide financial relief for those whose property was damaged nor maximum protection with the least expenditure. The first program of the management plan is a storm water facilities plan to propose physical improvements minimizing flood damage to existing areas and to insure that future development does not create similar flood problems. Drainage detention basins ranging from 116 to 216 acres were suggested. Land use, population projections and storm water runoff were studied to provide for future needs. Alternative plan 'A' was selected which would clean existing drainage channels; install 4 detention basins; improve certain headwells and culvert entrances, install inlet bar grates and replace drop inlets with standard inlets; construct curbs, gutters and underground sewers where detention basins are not feasible. The second part of the plan is a flood plain zoning ordinance to prevent new or reconstructed buildings from improperly encroaching on flood plains where the building might be damaged or might contribute to the intensity of downstream flooding. The third element of the management plan is federally subsidized flood plain insurance to insure existing buildings and property. (Gentry-North Carolina)

FLOOD MITIGATION STRATEGIES: THE ROLE OF INSURANCE AND STRUCTURAL MEASURES,
New South Wales Dept. of Agriculture, Sydney (Australia).
G. A. Forsythe.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers Australia, Preprints of Papers, p. 10 - 14, June 1976. 3 ref.

Descriptors: *Flood mitigation, *Flood plain insurance, *Cost-benefit analysis, *Flood control, Non-structural alternatives, Flood protection, *Australia.

Recent occurrences of flooding in Australia have highlighted the inadequacy of existing flood mitigation policy, which relies heavily on structural measures. These measures, and insurance as a non-structural alternative, are analysed in terms of a multidimensional social welfare function. A third alternative strategy, with insurance as a base, and utilizing structural measures where feasible, is shown to effectively maximize the beneficial features of both measures. Problems relating to the workability of such a scheme are outlined. (CSIRO)

FLOOD STANDARDS - THE ROLE OF ENGINEERING INSTITUTIONS,
Binnie and Partners, Melbourne (Australia).
F. M. Law.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers, Australia, Preprints of Papers, p. 15 - 19, June 1976. 2 tab, 26 ref.

Descriptors: *Design standards, *Institutions, *Dam design, *Flood protection, Design criteria, Design flood, Dam failure, Project planning, Safety factors, *Australia, United States.

Subjective factors influencing the setting of flood standards are examined, with particular reference to dam safety. Recent work in Britain and Australia is compared with that in America. Standards for protecting agricultural land which may be desired by a financing authority are discussed in relation to a British example. It is concluded that professional engineering institutions offer the best means of reconciling conflicts of safety and economy in so far as these are governed by arbitrary standards. (CSIRO)

THE NATION'S INCREASING VULNERABILITY TO FLOOD CATASTROPHE,
J. E. Goddard.
Journal of Soil and Water Conservation, Vol 31, No 2, p 48-52, March-April 1976. 5 p 1 photo, 3 tab, 3 chart.

Descriptors: *Flood damage, *Flood plains, *Flood plain insurance, *Flood plain zoning, *Floods, Flood discharge, Flood protection, Flood recurrence interval, Floodgates, Warning systems, Diversion structures, Diversion dams, Civil engineering, Dams, Dikes, Drainage systems, State governments.

Since 1936 the federal government's response to floodplain management has generally been limited to the construction of flood control structures such as levees, walls, and detention reservoirs. These structures are designed to safeguard only against moderate floods, and thus have been ineffective against major floods. A more widespread solution should be implemented. Flood insurance, which is now almost mandatory for floodplain structures, should have universal application in flood prone areas. A major improvement should come with the advent of floodplain planning and floodplain regulations. These involve application of the police power by a locality to guide and control land use and development in flood-hazard areas. Zoning, subdivision regulations, building codes and health regulations will be the specific tools used. Furthermore, open areas are needed to provide for the passage of floodwaters. This, when combined with floodproofing, will assure minimal damage from floodwaters. (Frank-Florida)

FLOODPLAIN MANAGEMENT: THE IOWA EXPERIENCE,
Iowa State Water Resources Research Inst., Ames.
M. D. Dougal.
Journal of Soil and Water Conservation, Vol 31, No 2, p 60-2, March-April 1976. 3 p, 1 photo, 5 ref.

Descriptors: *Iowa, *Legislation, *Flood protection, *Flood plain insurance, *Flood plain zoning, Civil engineering, Dikes, Drainage systems, Diversion dams, Floodgates, Warning systems, Federal government, State governments, Floods, Flood discharge, Zoning.

Iowa has been among the nation's leaders in tak floodplain management steps. Urged on devastating floods in 1944 and 1947, the legislat created the Iowa Natural Resources Counci 1949. The Council had the following goals: pro tion of life and property from floods; preven of damage to lands; implementation of an ord and systematic land use plan. In connection v the development, Iowa City enacted the first cessful floodplain zoning ordinance in 1962 obtaining the support of the legal profession, l realtors, and land developers. Iowa's experie was watched closely by other cities; now, o such ordinances are being developed throug the state. The enrollment rate in federal floo surance plans has also increased greatly. Probl still to be overcome include increasing urba tion, and the need for a statewide study of st straightening problems, and for greater cons tion of flood control engineering works. (Fr Florida)

ıe environmental effects of estuarine canal con-
ruction to provide waterfront housing and the
gulatory requirements to avoid ecological harm
e discussed. Real estate development canals in
yfills, inland, and intertidal developments
reaten wetland vegetation, water quality, bottom
bitats, and faunal changes with deleterious ef-
cts on fisheries. Because federal legislation
onfirmed by court decisions) regulates dredging
d filling below the high tide water mark
velopers have turned to excavating wetland
eas above the mean high tide, with Corps of En-
ieers permits only required for construction of
cess canals to navigable waters. The reluctance
the Corps to regulate dredging and filling in wet-
ıds was overcome by the court decision of
arch 27, 1975. Preliminary guidelines for the lo-
tion and design of inland canals are proposed,
cluding residential lot restrictions to high
ound; access canals to follow the shortest route
d avoid damage to intertidal marshes, sub-
erged grass beds, and oyster reefs; turbidity and
diment dispersion controls; canals to be en-
ieered as flow-through systems, supplemented
pumps; canal depth should be uniform and
thin the euphotic zone, or shallowing away from
parent body; and septic tanks and sewage ef-
ents to be disallowed in the development.

**E ENVIRONMENTAL IMPACT OF A
RGE TROPICAL RESERVOIR: GUIDELINES
R POLICY AND PLANNING. BASED UPON
ASE STUDY OF LAKE VOLTA, GHANA, IN
3 AND 1974,**
thsonian Institution, Washington, D. C.
I. Freeman.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-247 430, Price codes: A05 in paper copy, A01 in microfiche. Prepared for the Agency for International Development, 1974. 97 p, 6 fig, 7 plates, 6 tab, 51 ref, append. AID/csd-2608.

Descriptors: *Planning, Social aspects, Economics, *Environmental effects, *Reservoirs, *Dams, *Planning, *Water resources development, Alternative planning, Lakes, Data, Social impact, Fish, Nutrients, Erosion, Irrigation, Africa.
Identifiers: *Lake Volta(Ghana), *Schistosomiasis *Volta River Authority, Malaria, *Ecological impacts.

By the year 2000, the portion of the world's streamflow regulated by reservoirs will increase from one-tenth to two-thirds. Many new reservoirs will be located in the tropics where reservoirs have been shown to create problems: ecological - water weeds, evaporation and/or sedimentation, obstruction of fish migration and perturbation of downstream hydrology and aquatic systems; health - impounded water as a growth medium for malaria and schistosmiasis; social and economic - resettling people from rich alluvial and flood plain farmlands. Using the Volta Lake case study and other published experience, a brief narrative of like ly impacts is given, followed by questions that should be asked to determine impacts. Guidelines are given for (1) environmental assessment of alternative impoundment sites - seismic and hydrological impacts, effect on natural rivers and forests, effects on archaelogical remains, effects on human settlements and farmland, impacts below damsite; (2) assessment of hydrological and biological impacts following dam closure; (3) assessment of environmental and ecological impacts of a tropical reservoir, including lake geology, groundwater geology, lake topography, mineral cycling, plankton, aquatic plants, fish nutrition and production, water supply and sewage, control of disease. Researchers found it was not possible to assess lake effects on groundwater movement. The main variable for the lake appears to be runoff. Problems of exposure to schistosmiasis and bacterial contamination complicate use of the lake as a water supply. Lake assimilative capacity for wastewaters is great and agricultural and industrial wastewaters are not current problems. (Gentry-North Carolina)

Identifiers: *Malibu(CA), Santa Monica Mountains, Special purpose agencies, Socioeconomic environment, South Coast Regional Commission(CA), General Plan for Los Angeles County(CA), Pepperdine University(CA).

An attempt is made to identify and assess the role of government agencies in the planning and decision-making processes affecting land use, coastal resources, air quality, water quality, flooding, soils, seismic safety, wildlife, recreation and transportation in the Malibu watershed area. Regulatory controls on development include building permits, Coastal Commission permits, air quality controls, water quality controls, and the availability of essential services such as water supply, sewage treatment and access roads. Problems with current environmental management include: planners and policy-makers at the local level are not sufficiently responsive to the public; there is poor coordination among local agencies administering regulations governing water quality control sanitation, fire protection and other essential services; no mechanism exists to coordinate regional, state or national special purpose agencies protecting a critical resource, or to resolve conflicts between special purpose agency objectives and policies; delays in preparation and implementation of plans may give time for actions to be taken which reduce the effectiveness of those plans or controls. Recommendations are: special purpose agencies should be coordinated at the state level by an umbrella agency, which would take over the role of comprehensive planning; a special agency should be established to protect the special environmental significance of the Santa Monica Mountains; reforms to provide checks and balances on the Board of Supervisors and Regional Planning Commission should be instituted. (Gentry-North Carolina)

CONTRACTING FOR SOCIAL IMPACT ASSESSMENT,
G. E. Willeke, and C. A. Willeke.
Prepared for the Army Corps of Engineers, Institute for Water Resources, Fort Belvoir, VA. Final Report. IWR Contract Report 76-1, June 1976. 39 p, 1 tab, 3 ref, append. DACW31-75-M-1574.

Descriptors: *Contracts, *Research and development, *Social aspects, *Economic impact, *Social impact.
Identifiers: *Social Impact Assessments(SIA), National Environmental Policy Act of 1969.

Social Impact Assessments (SIA) have become increasingly more important since the passage of the National Environmental Policy Act of 1969. The problems a contracting agency (usually an Army Engineer District) faces are locating the best qualified contractors in the new field (a market development problem), writing an adequate Statement of Work Tasks, and adequately monitoring the contract and utilization of results. At the District and Division level, recommendations are: supplement advertising in Commerce Business Daily with ads in newsletters and journals, presentations at meetings and direct solicitation; addition of social scientists to District and Division staffs; improving the Scope of Work statement; use of fuller range of contracting options, such as limited competition for contracts; consolidating related SIAs into a single contract; have more than one person monitor a contract. Recommendations for the Headquarters level are: have more planners and project coordinators attend courses on contracting; facilitate feedback of Office of the Chief of Engineers (OCE) and Board of Engineers for Rivers and Harbors (BERH) reactions to impact assessments; OCE should publish a summary of the Corps' budget each year; OCE, through the Institute for Water Resources (IWR), should accumulate files on the social impact of water resources facilities and programs; develop and refine computer and data base capability; encourage use of questionnaires and interview schedules; the Department of Commerce should consolidate SIA contract advertisements into a specified area in the Commerce Business Daily so that the periodical will be more effective in reaching SIA contractors. THE SOCIAL AND ECONOMIC IMPORTANCE OF THE CARONI SWAMP IN TRINIDAD AND TOBAGO,
Michigan Univ., Ann Arbor. Dept. of Natural Resources.
B. S. Ramdial.
Ph. D. Thesis, 1975. 269 p, 24 fig, 9 tab, 9 append.

Descriptors: Mangrove swamps, Ecosystems, Evaluation, Fishing, Shellfish, Natural resources, *Swamps, Land use, Recreation demand, Resources, Tourism, National Parks, Economics, Social values, Water resources, Lagoons, Estuaries, Wetlands.
Identifiers: Trinidad, Tobago, Fin fish, Caroni Swamp(Trinadad-Tobago).

The purpose of this study was to assess the social and economic values of the Caroni Swamp as of 1974 and to generate more attention and wider public interest in one of Trinidad and Tobago's most beautiful landscapes. The study finds various unmet need states such as temporary escape, experiencing nature, intellectual stimulation, affiliation, achievement and physical exercise are gratified by a visit to the Swamp. Over 90% of the visitors thought it worthy of preservation. The study estimates the recreational resources of the Swamp at $1,038,500 and the number of persons earning a living at 240 full-time and 105 part-time. It estimates the fin and shell fish harvest and value at 1,580,170 lbs. and $981,450 and based on a total annual return of $2,020,020, calculates the present worth of the Swamp at $4,000 per acre. The study concludes that the Swamp, though neglected, has many social and economic values beyond tourism. It is biologically productive and it is recommended that the Swamp be declared a National Park. (NOAA)

ENVIRONMENTAL ASSESSMENT OF THE ALASKAN CONTINENTAL SHELF. VOLUME 8, EFFECTS OF CONTAMINANTS.
National Oceanic and Atmospheric Administration, Boulder, Colo. Environmental Research Labs.
NOAA, Environmental Research Laboratories Principal Investigators' Reports for the Year Ending March 1976, April 1976. 392 p.

Descriptors: Resources development, *Environmental effects, *Toxicity, Pollutants, *Oil pollution, *Photosynthesis, *Water pollution effects, *Alaska, *Continental Shelf, Ecology, Baseline studies, Assessments, Distribution, Ecosystems, Fishes.
Identifiers: *Outer Continental Shelf, *Gulf of Alaska, Bering Sea, *Hydrocarbons, *Biological effects, *Petroleum hydrocarbons, *Sea grasses, Contaminants, Petroleum, Sublethal effects, Trace metals, Arctic Oceans, Subarctic waters, Crude oil.

This is the eighth volume of a set of fourteen which present baseline studies of the natural resources of the Alaska Continental Shelf as well as studies of the environmental effects of the development of the resources in that area with particular emphasis on oil pollution. This volume contains the following studies: The Physiological Effect of Acute and Chronic Exposure to Hydrocarbons and of Petroleum on the Near-Shore Fishes of the Bering Sea; Physiological Impact of Oil on Pinnipeds; Acute and Chronic Toxicity, Uptake, and Depuration and Sublethal Metabolic Response of Alaskan Marine Organisms to Petroleum Hydrocarbons; Sublethal Effects as Reflected by Morphological, Chemical, Physiological, and Behavioral Indices; Identification of Major Processes in Biotransformations of Petroleum Hydrocarbons and Trace Metals Assessment of Available Literature on Effects of Oil Pollution on Biota in Arctic and Subarctic Waters; Acute Effects - Pacific Herring Roe in Gulf of Alaska: Acute and Chronic Toxicity of Sea-Water Extracts of Alaskan Crude Oil to Zoese of the Dungeness Crab, Cancer magister, Dana; and Sublethal Effects - Effects on Seagrass Photosynthesis. (NOAA)

ENVIRONMENTAL ASSESSMENT OF THE ALASKAN CONTINENTAL SHELF. VOLUME 9. CHEMISTRY AND MICROBIOLOGY.
National Oceanic and Atmospheric Administration, Boulder, Colo. Environmental Research Labs.
NOAA, Environmental Research Laboratories Principal Investigators' Reports for the Year Ending March 1976, April 1976. 555 p.

Descriptors: Resources development, *Environmental effects, Pollutants, *Sea ice, *Aromatic compounds, *Trace elements, *Alaska, *Continental shelf, Ecology, Baseline studies, Assessments, Distribution, Ecosystems, *Chemistry, *Microbiology, Microorganisms.
Identifiers: *Outer Continental Shelf, *Gulf of Alaska, Bering Sea, Beaufort Sea, Petroleum, Hydrocarbons.

This is the ninth volume of a set of fourteen which present baseline studies of the natural resources of the Alaska Continental Shelf as well as studies of the environmental effects of the development of the resources in that area with particular emphasis on oil pollution. This volume contains the following studies: Assessment of Potential Interactions of Microorganisms and Pollutants Resulting from Petroleum Development on the Outer Continental Shelf in the Beaufort Sea; Assessment of Potential Interactions of Microorganisms and Pollutants Resulting from Petroleum Development on the Outer Continental Shelf in the Gulf of Alaska: Trace Hydrocarbon Analysis in Previously Studied Matrices and Methods Development for: (A) Trace Hydrocarbon Analysis in Sea Ice and at the Sea Ice-Water Interface, (B) Analysis of Individual High Molecular Weight Aromatic Hydrocarbons; Environmental Assessment of Alaskan Waters - Trace Element Methodology - Inorganic Elements; and Distribution of Light Hydrocarbons, C1-C4, in the Gulf of Alaska and Southeastern Bering Shelf. (NOAA)
W77-00909

ENVIRONMENTAL ASSESSMENT OF THE ALASKAN CONTINENTAL SHELF. VOLUME 10. CHEMISTRY AND MICROBIOLOGY.
National Oceanic and Atmospheric Administration, Boulder, Colo. Environmental Research Labs.
NOAA, Environmental Research Laboratories Principal Investigators' Reports for the Year Ending March 1976, April 1976. 436 p.

Descriptors: Resources development, *Environmental effects, *Oil pollution, *Pathology, *Heavy metals, *Alaska, *Continental Shelf, Ecology, Baseline studies, Assessments, Distribution, Ecosystems, Bacteria.
Identifiers: *Outer Continental Shelf, *Gulf of Alaska, Bering Sea, Beaufort Sea, Crude oil, Psychrophilic bacteria.

This is the tenth volume of a set of fourteen which present baseline studies of the natural resources of the Alaska Continental Shelf as well as studies of the environmental effects of the development of the resources in that area with particular emphasis on oil pollution. This volume contains the following studies: Natural Distribution of Trace Heavy Metals and Environmental Background in Three Alaskan Shelf Areas; Baseline Study of Microbial Activity in the Beaufort Sea and Gulf of Alaska and Analysis of Crude Oil Degradation by Psychrophilic Bacteria; Hydrocarbons: Natural Distribution and Dynamics on the Alaskan Outer Continental Shelf; Microbial Release of Soluble Trace Metals from Oil-Impacted Sediments; and Incidence of Pathology of Marine Fish Diseases in the Gulf of Alaska, Bering Sea, and Beaufort Sea. (NOAA)
W77-00910

ENVIRONMENTAL ASSESSMENT OF THE ALASKAN CONTINENTAL SHELF. VOLUME II. PHYSICAL OCEANOGRAPHY AND METEOROLOGY.
National Oceanic and Atmospheric Administration, Boulder, Colo. Environmental Research Lab.
NOAA, Environmental Research Laboratories Principal Investigators' Reports for the Year Ending March 1976, April 1976. 996 p.

Descriptors: Resources development, *Environmental effects, *Oceanography, *Meteorology, Pollutants, *Continental Shelf, *Alaska, Ecology, Baseline studies, Assessments, Ecosystems, Ocean currents, Ocean circulation, Climatology, *Oil pollution.
Identifiers: *Outer Continental Shelf, *Gulf of Alaska, Bering Sea, Beaufort Sea, Oceanographic data, Current measurements, Water masses, Atmospheric models.

This is the eleventh volume of a set of fourteen which present baseline studies of the natural resources of the Alaska Continental Shelf as well as studies of the environmental effects of the development of the resources in that area with particular emphasis on oil pollution. This volume contains the following studies: Development and Operation of HF Current-Mapping Radar Units-

Physical Oceanography; Beaufort Shelf Surface Currents; Current Measurements in the Beaufort Sea; Effects of Seasonability and Variability of Streamflow on Nearshore Coastal Areas; Gulf of Alaska Study of Mesoscale Oceanographic Processes (Gas-MOP); Numerical Studies of Alaskan Region; Bristol Bay Oceanographic Processes (B-BOP); STD Mappings of the Beaufort Sea Shelf; Outer Continental Shelf Energy Program; Preparation of Hydrodynamical-Numerical and Three-Parameter Small-Mesh Atmospheric Models for Coastal Waters in the Gulf of Alaska; Mesoscale Currents and Water Masses in the Gulf of Alaska; Historical and Statistical Oceanographic Data Analysis and Ship of Opportunity Program; Transport of Pollutants in the Vicinity of Pradhoe Bay; Marine Climatology of the Gulf of Alaska and the Bering and Beaufort Seas; Physical Oceanography of the Gulf of Alaska; and Near-Shore Atmospheric Modification. (NOAA)
W77-00911

ENVIRONMENTAL ASSESSMENT OF THE ALASKAN CONTINENTAL SHELF. VOLUME 12. GEOLOGY.
National Oceanic and Atmospheric Administration, Boulder, Colo. Environmental Research Lab.
NOAA, Environmental Research Laboratories Principal Investigators' Reports for the Year Ending March 1976, April 1976. 679 p.

Descriptors: Resources development, *Environmental effects, Hazards, *Seismic studies, *Volcanoes, *Sedimentation, *Glacial sediments, *Geomorphology, *Permafrost, *Geology, *Alaska, *Continental shelf, Ecology, Baseline studies, Assessments, Distribution, Ecosystems, Suspended solids, Ice cover, *Oil pollution.
Identifiers: *Outer Continental Shelf, *Gulf of Alaska, Pribilof Islands, Aleutian Islands.

This is the twelfth volume of a set of fourteen which present baseline studies of the natural resources of the Alaska Continental Shelf as well as studies of the environmental effects of the development of the resources in that area with particular emphasis on oil pollution. This volume contains the following studies: Seismotectonic Study of the Seismic and Volcanic Hazards in Pribilof Islands - Eastern Aleutian Islands Region of the Bering Sea; Coastal Morphology and Sedimentation, Gulf Coast of Alaska (Glacial Sedimentation); The Environmental Geology and Geomorphology of the Gulf of Alaska Coastal Plain; Delineation and Engineering Characteristics of Permafrost beneath the Beaufort Sea; Distribution, Composition and Transport of Suspended Particulate Matter in the Gulf of Alaska and Southeastern Bering Shelf; Offshore Permafrost Studies, Beaufort Sea; and Marine Environmental Problems in the Ice Covered Beaufort Sea Shelf and Coastal Regions. (NOAA)

CARRYING CAPACITY PROTOTYPE INVESTIGATIONS IN THE STATE OF HAWAII, SUMMARY REPORT,
Hawaii State Office of Environmental Quality Control, Honolulu. Steering Committee on Carrying Capacity Studies.
February 1976. 48 p. 8 fig.

Descriptors: *Carrying capacity, *Growth rate, *Environment, *Natural resources, *Human population, Planning, *Hawaii, Water supply, Water quality, Model studies, Stress, Methodology, Decision Making.
Identifiers: *Overpopulation, Environment stress, Prototype studies, Maui(Hawaii), Oahu(Hawaii), Pearl Harbor(Hawaii).

The limited capacity of environmental systems to absorb growth and of resource systems to support growth, and the corresponding need to base future growth management decisions on an understanding of such limits are the underlying motives for the carrying capacity determinations of single systems while acknowledging that other interrelated systems may combine in synergistic and antagonistic effects. These studies were aimed at acquiring first-hand experience in dealing with the carrying capacity concept by addressing it for specific locations and from the perspective of representative resource and environment-related concerns. The procedures developed and used in these investigations characterize the elements of a methodology that are generalizable as a decision-making tool. The prototype studies were directed to a single system approach, i.e., on the provision of a water supply and the maintenance of water quality in specific segments of Hawaii, and to provide meaningful and practical results while stressing the need for an integrated approach to carrying capacity studies in order to address the spheres of decision-making related to growth, infrastructure and support systems, and to criteria and standards. Determination of various carrying capacities and their main implications provide a display of major tradeoffs associated with achieving selected environmental standards. (Auen-Wisconsin)

OPTIMAL TAXATION POLICIES FOR CONSERVATION AND RECYCLING,
Florida Univ., Gainesville. Dept. of Economics.
R. Lusky.
Journal of Economic Theory, Vol. 11, No. 3, p. 315-328, 1975. 5 fig., 5 ref.

Descriptors: *Recycling, *Administrative decisions, *Conservation, National resources, Mathematical models, Pollutants, Taxes, Government finance, Pollution charges(Taxes).

A fully integrated model of conservation, production, and recycling is presented in a framework of a natural resource cycle—beginning with extraction from a stock of the resource, moving to intermediate production, final consumption, and closing by recycling the consumption residuals. It is assumed that the natural resource stock affects both utility and the recycling activity. In a laissez-faire market equilibrium, consumers and producers fail to take into account the dynamic effect of the stock of resources due to lack of appropriability when deciding upon the optimal rate of extraction and recycling, no one takes into account his individual effect upon the stock nor the effect of the stock upon his own consumption and production. This failure results in a suboptimal rate of resource extraction. The model shows that centralized decision-making internalizes the stock externality and thereby produces the optimal allocation solution. Optimality can also be reached in a decentralized system with the use of the proper tax-cum-subsidy scheme. In the recycling model where the destruction of the recycled material is the original stock, the optimal solution involves a subsidy to firms engaging in recycling activities; this subsidy, which is separated from the necessary decentralized tax plan, was found to be equal to the value of an extra unit of the resource. (Auen-Wisconsin)

ENVIRONMENTAL PROTECTION AND SOCIAL ALLOCATION OF INVESTMENTS,
Erasmus Univ., Rotterdam (Netherlands).
A. P. Mastenbroek, and P. Nijkamp.

rnational Regional Science Review, Vol. 1, 1, p. 73-86, 1975. 2 fig., 1 tab., 8 ref.

criptors: *Pollution abatement, *Mathematical lels, *Investment, *Evaluation, Standards, nning, Economic efficiency, Air pollution, er pollution, Decision making.
ntifiers: *Environmental damages, vironmental standards.

near programming model is presented based on tiple sectors, multiple regions and multiple pol-nts (thus including input-output linkages and over effects) defines spatial allocation of in-ment activities both for productive and en-nmental purposes. It is designed for planning nomic activities which have environmental im-s and provides a quantitative basis for en-nmental administration, for planning of invest-t projects, for tax/subsidy regulations, etc. It rporates environmental standards which could be exceeded whatever the volume of industrial luction, or private consumption and of trans-ation may be. The implicit economic evalua- of environmental standards is reflected by low prices. The regional surplus (the sum of aggregated sectoral values minus the sum of costs of environmental deterioration in each on) is maximized subject to a set of con-nts. A comparison of the effects of an in-se in the damage costs of pollution (via ges or taxes) to the effects of a policy of cing admissible levels of pollution (by impos-quality standards) shows that the latter policy latively more effective. The shadow prices of ssion standards give indications of the societal ation of these standards. A nonlinear exten- of the environmental model focuses on the e of the cost curve of environmental deteri-ion as well as on the cost effects of environ-tal protection and pollution control. AN INEXPENSIVE THERMISTOR FLOWMETER FOR AQUATIC BIOLOGY,
Duke Univ., Durham, N. C. Dept. of Zoology.
M. LaBarbera, and S. Vogel.
Limnology and Oceanography, Vol. 21, No. 5, p 750-756, September 1976. 4 fig, 7 ref.

Descriptors: *Instrumentation, *Flowmeters, *Flow measurement, Flow rates, Equipment, Electronics, Electronic equipment, Measurement, Calibrations, Anemometer, Aquatic environment, Aquatic life, Biology.
Identifiers: *Thermistor flowmeters, Thermistors.

A newly developed thermistor flowmeter could measure current speeds from 0.2 to 50 cm/s with a spatial resolution of 0.1 cm and a response time of 200 ms. The output of the meter approximated a logarithmic function of the ambient water velocity. The flowmeter itself had a low power consumption, and the output could be stored on magnetic tape using a bettery-powered cassette recorder, which made possible a continuously recording portable or self-contained underwater unit. Descriptors: *Model studies, *Methodology, *Statistical methods, *Statistical models, Data collections, Estimating, Testing procedures, Analytical techniques, Correlation analysis, Regression analysis, Sampling, Water quality.

This report presents and discusses the basic statistical models and methods which are useful to researchers in the field of water resources research, as well as in other fields. These models and methods are presented from the standpoint of type (parametric and nonparametric - or distribution free) and purpose (e.g., simulteneous comparison of several means, comparison of two or more variances, establishment of a difference between two means with a specified confidence, etc.). Emphasis is primarily upon methodology; necessary assumptions upon which each model is based are included. No derivations or proofs are given, since these are found in numerous textbooks on statistics. Emphasis is also placed upon the need for the researcher to determine before obtaining data the type of statistical model and analysis required, so that he can use that model or method which is most powerful, and so that he will have the proper data to permit the most efficient analysis. Failure to carry out such preliminary planning relevant to the selection and application of a statistical model will almost result in either a lack of sufficient relevant data or in the gathering of extraneous data, either of which is unnecessarily costly. Each method is illustrated by an example, together with an interpretation of the result.

Hydrocomp, Inc., Palo Alto, Calif.
N. H. Crawford.
Simulation Network Newsletter, Vol. 8, No. 1, p 1-4, January 1976. 2 fig.

Descriptors: Technology, Hydrology, *Computers, *Communication, Water resources development, *Watershed management, *Decision making, Data collections.

Technical advances important to hydrology and water resources are taking place in computer hardware, communications, and software design. A water resource management system requires orderly organization of information, analysis of the consequences of decisions, operational criteria, and a means to implement the decisions that are taken. The most important current trend in computer hardware is toward ultra small and inexpensive logical components. A microcomputer can be built into a raingage or a streamgage, giving these devices decision making power. Transmission of field data to satellites, followed by readout into a data bank is currently being tested in the United States. Such a system is practical even if the data are not used in real-time, if the satellite can collect data at lower cost than the alternate field trip to the gage site. Software needs include data base systems that store, update, and retrieve time series; simulation software to investigate policy and development alternatives; system management software to locate optimum or near optimum control strategies; and interactive or conversational linkages between the user and the other types of software. The cost of software in water resource systems already exceeds the hardware costs and will probably increase. (Snyder-FIRL)

WATER RESOURCES OF THE ROCK RIVER WATERSHED, SOUTHWESTERN MINNESOTA,
Geological Survey, St. Paul, Minn.
H. W. Anderson, Jr., W. L. Broussard, D. F. Farrell, and P. E. Felsheim.
Available from Branch of Distribution, USGS, 1200 S. Eads St., Arlington, Va 22202, price $1.75. Hydrologic Investigations Atlas HA-555, 1976. 3 sheets, 14 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Water quality, *Minnesota, Water supply, Hydrologic data, Streamflow, Floods, Low flow, Hydrogeology, Aquifer characteristics, Groundwater movement, Dissolved solids, Duration curves, Hydrographs, Maps.
Identifiers: *Rock River(Minn), Missouri River tributary.

This Hydrologic Atlas is one of series describing the 39 watershed units in Minnesota. The 1,750 sq mi in the Rock River watershed are glaciated upland plain including all of Rock County and parts of Pipestone, Murray, Lincoln, Nobles and Jackson Counties. The average annual water budget shows 25.8 inches precipitation, 3.1 inches surface runoff and 22.7 inches evapotranspiration. Water use in million gallons for 1970 was 3,333 ground water and 274 surface water. Domestic supplies accounted for 37 percent livestock 37 percent, and industrial 26 percent of total use. All 18 municipalities use ground water, mostly from glacial drift, seven use water from Precambrian aquifers. Precipitation recharges ground water through glacial deposits. Water-table and potentiometric maps and section show ground-water movement. Highest streamflow results from snowmelt and spring rains followed by recession in flow through summer, fall, and winter. Surface water and ground water are both very hard. Surface water and water from surficial and shallow drift aquifers generally range from 450 to 1,000 mg/liter dissolved-solids concentrations. Water from deep drift and from bedrock generally exceeds 1,000 mg/liter dissolved-solids concentration except where Precambiian quartzite aquifers underlie pre-Wisconsin drift. (Woodard-USGS)
W77-00848

WATER RESOURCES OF THE ROOT RIVER WATERSHED, SOUTHEASTERN MINNESOTA,
Geological Survey, St. Paul, Minn.
W. L. Broussard, D. F. Farrell, H. W. Anderson, Jr., and P. E. Felsheim.
Available from Branch of Distribution, USGS, 1200 S. Eads St., Arlington, Va 22202 Price $4.25. Hydrologic Investigations Atlas HA-548, 1976. 3 sheets, 9 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Water quality, *Minnesota, Water supply, Hydrologic data, Streamflow, Flow rates, Hydrogeology, Aquifer characteristics, Groundwater movement, Surface-groundwater relationships, Dissolved solids, Duration curves, Hydrographs, Maps.
Identifiers: *Root River(Minn).

This Hydrologic Atlas is one of a series describing the 39 watersheds in Minnesota. The Root River watershed includes Houston, Winona, and parts of the surrounding counties. The 2,570 square miles in the watershed varies from gently rolling prairie in the west to an area of plateaus separated by valleys deeply incised into bedrock in the north and east. The average annual water budget for 30 years shows 29.5 inches of precipitation, 7.2 inches of surface runoff, and 22.3 inches of evapotranspiration. Water use in millions of gallons for 1970 was established at 7,310 of ground water and 6,700 of surface water. Domestic supplies accounted for less than one fourth and thermoelectric power for about one half of the total use. All 33 municipalities use ground water from bedrock aquifers, and 21 of those obtain at least part of their supply from the Prairie du Chien-Jordan aquifer. Many private domestic wells are completed in a shallow limestone aquifer. The ground-water system is recharged primarily by infiltrating precipitation in upland areas Ground-water movement is indicated by water-table and potentiometric maps and section diagrams. Water from bedrock and glacial aquifers generally is of acceptable quality f domestic use, dissolved solids generally less th 400 mg/liter very hard, and locally high iron co tent. The Mount Simon-Red clastics aquifer is l cally saline. Runoff is greatest during the spri when snowmelt occurs and the soils are general saturated. (Woodard-USGS)
W77-00849

GEOHYDROLOGY OF THE LOWLAND LAKE AREA, ANCHORAGE, ALASKA,
Geological Survey, Anchorage, Alaska.
C. Zenone.
Water-Resources Investigations 76-22, 1976. sheets, 11 fig, 12 ref.

Descriptors: *Groundwater resources, *Lake *Hydrogeology, *Urbanization, *Alaska, Aquif characteristics, Glacial sediments, Water level Water demand, Water utilization, Maps, Surfac groundwater relationships.
Identifiers: *Anchorage(Alaska).

Unconsolidated deposits, chiefly of glacial orig make up the surficial geologic materials in t Anchorage lowland lakes area, the western part the Anchorage glacial outwash plain. Postglaci accumulation of peat, commonly 5 to 10 feet thic and the presence of ground water at or very ne the surface combine to create the swamp-musk terrane of much of the area. Deeper, confine ground water is also present beneath thick silt a clay layers that underlie the surficial deposit Domestic water supply for the lowland lakes ar is provided largely by public-supply wel completed in the deep, confined aquifers. No lar perennial streams traverse the area, thus strea flow is not a major parameter in the area's natur water balance. The major uses of surface wat are recreational, including fishing and boating several of the larger lakes, and private and co mercial aircraft operations at Hood-Spena Lakes floatplane base. The hydrology and wat balance of these lakes is complex. Water levels some lakes appear to be closely related to adjace ground-water levels. Other lakes are evident perched above the local water table. The relati of lake level to adjacent ground-water level m vary along the shoreline of a single lake. The effe of residential development practices on lake bas water balance is not completely understood. Sand Lake, the largest lake in this area of rapid u banization, the water level has declined about feet since the early 1960's. (Woodard-USGS)

GEOHYDROLOGY AND WATER SUPPL SHEYMA ISLAND, ALASKA,
Geological Survey, Anchorage, Alaska.
A. H. Feulner, C. Zonone, and K. M. Reed.
Open-file map report 76-82, 1976. 1 sheet, 4 fig, tab, 6 ref.

Descriptors: *Water supply developmen *Surface waters, *Groundwater, *Water qualit *Alaska, Available water, Hydrogeology, Da collections, Surface-groundwater relationship Maps.
Identifiers: *Shemya Island(Alaska).

Sheyma Island, Alaska, was occupied as a milita base in 1942. Since that time, potable water h been supplied by streams, lakes, wells, and in t late 1950's, a gallery system. The island is a lo lying, wave-cut platform composed of pyroclast and volcanic rocks with some intrusives. Bedroc is overlain by thin glacial deposits. Most of t island's present surface is relatively thick pe deposits. On the southern and western sides of t island active sand dunes are present. Groun water supplies are limited by the dense bedroc only a small amount of water penetrates into fra ture systems. Most ground-water movement is the overlying glacial and peat deposits. Groun water moves generally from north to south acro the island. Currently water supplies are draw

m the gallery system which is capable of viding about 200,000 gallons per day. An emer- cy water supply is available from two wells. ditional supplies could be developed by either ling to the existing gallery or constructing an litional gallery near the present gallery system. e chemical quality of water analyzed from the ery well generally approximates that of surface er on the island. None of the constituents in nples from streams, lakes, or ground water, ex- t the August 27, 1970, analysis for Lower ke, exceed the recommended limits for drinking er (Environmental Protection Agency, 1973). oodard-USGS)

SURFACE WATER SUPPLY OF THE UNITED STATES, 1966-70: PART II. PACIFIC SLOPE BASINS IN CALIFORNIA--VOLUME 2. BASINS FROM ARROYO GRANDE TO OREGON STATE LINE EXCEPT CENTRAL VALLEY.
Geological Survey, Reston, Va.
Available from the Supt. of Documents, GPO, Washington, DC 20402, Price $5.55. Water-Supply Paper 2129, 1976. 678 p, 1 fig.

Descriptors: *Hydrologic data, *Surface waters, *Streamflow, *Lakes, *California, Oregon, River basins, Runoff, Discharge(Water), Gaging stations, Flow measurement, Average flow, Reservoir stages.
Identifiers: *Pacific Slope basins(Calif).

This is one of 37 reports presenting records of stage and discharge of streams, and of stage and contents of lakes and reservoirs in the United States during the 1966-70 water years; it contains the records for gaging stations and partial-record stations in the Pacific slope basins in California from Arroyo Grande to Oregon State line except Central Valley. This report is one of the second series of water-supply papers to be published on a 5-year basis. The first series covered the 5-year period October 1, 1960, to September 30, 1965. This series covers the period October 1, 1965, to September 30, 1970. The daily table for stream-gaging stations gives the mean discharge for each day and is followed by monthly and yearly summaries of total, average, maximum, and minimum, discharges. (Woodard-USGS)

STATISTICS: WHEN WILL WE EVER LEARN,
Queensland Irrigation and Water Supply Commission, Brisbane (Australia). Surface Water Resources Branch.
N. M. Ashkanasy.
In: Hydrology Symposium, Sydney, Australia, 1976. The Institution of Engineers Australia, Preprints of Papers, p. 30 - 34, June 1976. 1 fig., 4 tab., 21 ref.

Descriptors: *Statistical methods, Risks, Forecasting, Frequency analysis, Flood mitigation, Monte Carlo method, Distribution patterns.

Statistics are playing role in engineering evaluation, but doubts exist as to whether engineers' and hydrologists' grasp of the concept of risk is much better than that of the general public. Use of such terms as 'return period' and 'recurrence interval' do nothing to dispell such doubts. A concept of risk is developed based on the product of uncertainty arising out of each step in a statistical evaluation. The basic theory behind development and utilization of frequency distributions is discussed, but it appears that there is little statistical evidence to distinguish between them, especially in the light of the doubts which exist about their underlying assumptions. Recent 'Monte Carlo' experiments indicate furthermore that knowledge of the 'right' distribution is less important than even a limited knowledge about other factors involved in the design of flood alleviation

policies and structures. It is concluded that engineers and hydrologists need to carefully review their attitudes if statistical methods are to be wisely used. (CSIRO)

INFLUENCE OF ICE UPON CONSTRUCTION, AND METHODS OF COMBATTING ICE PROBLEMS.
Army Cold Region Research and Engineering Lab., Hanover, N. H.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-012 005, Price codes: A08 in paper copy, A01 in microfiche. CREEL Draft Translation 422, October 1974. 276 p. Translated from Trudy Koordinatsionnykh Soveshchaniy po Gidroteknike (Translation of Coordinating Conference on Hydraulic Engineering), No. 17, 1965.

Descriptors: *Ice, *Ice cover, *Construction, *Arctic, Cold regions, Ice jams, Cold weather construction, Hydraulic structures, Reservoirs, Harbors, Rivers, Equations, Navigation, Bridges, Civil engineering, Structures.
Identifiers: *Ice cover effects, *Ice loads, Ice pressure, Ice cover strength.

This collection of 25 articles dealt with the variety of ice related factors which influences the specifications for building in an arctic environment. Based on the studies done concerning the effect of ice on completed structures, these articles presented logical approaches to estimating effective ice loads and how to determine the necessary ice protective measures while building reservoirs, hydraulic structures, harbor slips, etc. Several articles were concerned with how to weaken ice strength or increase the rate of thawing. Descriptors: *Channels, *Channel morpholog *Model studies, Mathematical models, Regim Alluvial channels, Flow, Streamflow, Bank Equations, Deposition(Sediments), Sediment tion, Tractive forces, Sediment transport, Er sion, Sedimentology.

Interest in the design of stable stream channels h been spurred by recent problems of channel s bility on artificially straightened or newly co structed channels. Solutions are not readily avai ble. This report the second of two papers deali with stream channel stability, was based on da collected at straight, stable reaches of a lar number of stream gaging stations in or ne Oklahoma. Cross sections of two differe straight, stable reaches at each station were us to calculate channel slopes, cross-sectional area and other characteristics. Samples of the bank a bed materials were analyzed for Atterberg limi pH, particle-size distribution, angle of repose, a cation exchange capacity. The first pap presented a statistical evaluation of the relati between the channel characteristics and t characteristics of the bank and bed materials. Th second paper presented the regime and tracti force theories of channel design, based on the sumption that the channels are in balance. It al related the bank and bed materials characterist to the channel characteristics through the regi and tractive force equations of stable chann design. (See also W77-00775) (Sims-ISWS)

WAVE GENERATOR,
M. W. Gustafson, and K. R. Loqvist.
U.S. Patent No. 3,965,364, 5 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 947, No 4, p 1821, June 22, 1976.

Descriptors: *Patents, *Waves(Water), *Ocean waves, *Energy, *Energy conversion, Energy transfer, Floats, Floating, Buoyancy, Turbines.

A device for utilizing energy stored in wave motion is described. At least one buoyant body floating on the water surface and moving vertically with the waves is connected to at least one restraining energy recipient. The buoyant body or float is anchored in a way which permits unrestricted movement in an essentially vertical direction independently of the wave height and water depth when acted upon by the heaving waves. One lower member connected to the buoyant body is comprised of at least two oppositely rotating propellers on different vertical shafts. The propellers are positioned at a distance below the buoyant body which locates them fully or partially at a depth where the surrounding water has substantially no vertical motion. The reciprocating vertical motion generated by the waves, forces the propellers to rotate as they are being moved through the tranquil water layers. The propeller drive one common or two separate pumps which pump water into a pressure vessel that is partly filled with air. This vessel is connected to a water turbine. The turbine or the propellers can be used to drive an electric generator. (Sinha-OEIS)
W77-00691

POWER GENERATING MACHINE ACTUATED BY OCEAN SWELLS,
E. L. Parr.
U.S. Patent No. 3,965,365, 9 p, 14 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 947, No 4, p 1821, June 22, 1976.

Descriptors: *Patents, *Waves(Water), *Ocean waves, *Energy, *Energy conversion, *Energy transfer, Equipment, Floating, Buoyancy, Powerplants.
Identifiers: Ocean swells.

A power generating machine is actuated by the continuous swells occurring in the ocean. The machine is supported on a pair of spaced main floats, between which is a power float connected to a linkage which allows the power float to reciprocate vertically with the passing swells. A flywheel is driven through a one way clutch connected to the float linkage to drive an electrical generator, the linkage also being coupled to an air compressor. Sensing floats privotally attached to the main float support structure detect the contour of the swells and, through associated drive means, cause the spacing of the main floats to be adjusted to the existing swells crest spacing for maximum efficiency. (Sinha-OEIS)
W77-00692

LINE STATUS TRANSDUCER,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
U. Milano.
Report REC-ERC-76-17, October 1976. 9 p, 6 fig, 1 tab.

Descriptors: Voltage regulations, Electrical insulators, Transmission lines, Electronic equipment, Instrumentation, Power system operation.
Identifiers: Photoelectricity, High voltage, Capacitive voltage dividers, Transmission line status indicators, Insulator potential detectors, High-voltage dividers, Electrical status indicators, On-off potential detectors, *Transducers.

The line status transducer was developed to provide an inexpensive and reliable means of obtaining an indication as to whether an electric power system segment is energized or deenergized. Status information is derived from the voltage sensed across a modified electrical insulator. The insulating qualities of the insulator are unaffected by the addition of the sensor. The transducer can monitor any power system segment operating at or above 13.8 kV (line to line). Included in the report are descriptions of circuit functions, installation, alinement, and evaluation tests. (Bur of Reclam)
W77-00738

HYDRAULIC MODEL STUDIES OF NAVAJO DAM AUXILIARY OUTLET WORKS AND HOLLOW-JET VALVE BYPASS--MODIFICATIONS TO REDUCE DISSOLVED GAS SUPERSATURATION,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
P. L. Johnson.
Report REC-ERC-76-5, April 1976. 30 p, 19 fig, 2 tab, 2 ref.

Descriptors: *Supersaturation, *Dissolved gases, *Outlet works, Cavitation, Energy dissipation, Erosion, *Hydraulic models, Design, Model studies, Dams, *New Mexico, Jets, Valves.*
Identifiers: *Navajo Dam(N Mex).

Operation of the auxiliary outlet works and the 762-mm (30-inch) hollow-jet valve bypass at Navajo Dam results in high levels of dissolved gas supersaturation in released waters. These high dissolved gas levels, which are caused by the deep penetration of the flow into the spillway stilling basin pool, have had adverse effects on the fishery. Structural modifications were considered which included a flattening of the trajectory of the jet from the 762-mm (30-inch) bypass and the addition of a deflector or flip lip to the auxiliary outlet works. A 1:48 scale hydraulic model was used to refine and evaluate these modifications. Depth of jet penetration, degree of energy dissipation, strength of back eddies returning into the stilling basin, potential for cavitation development below the flip lip, and simplicity of design were factors considered in the evaluation. (Bur of Reclam)

DESIGN LIMITS ON CRITICAL FLOAT EMERGENCE IN A TETHERED FLOAT BREAKWATER,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
D. M. Hanes, and R. J. Seymour.
Sea Grant Publication No. 44, IRM Reference 76-2, January 1976. 12 p, 4 fig, 1 tab, 3 ref. NOAA-04-5-158-20.

Descriptors: *Breakwaters, *Design criteria, *Engineering structures, *Shore protection, Floats, Barriers, Coastal structures, Ocean waves.
Identifiers: *Tethered floats, Wave attenuation, Ballast.

An investigation was undertaken to determine if a limiting relationship exists between the float diameter and the length of the ballast section in the beam direction. In a random sea, the ballast/float assembly attempts to follow the sea surface variations and to move towards an equilibrium between buoyant and inertial forces. Assuming a large number of floats per rigid ballast section, a fixed ballast length (B), and a constant volume of floats independent of float diameter (D), the attitude of the ballast can be considered to be nearly independent of float diameter. It was concluded under conditions of limited fetch and short wave lengths, selection of small float diameters and reasonable ballast lengths could result in a critical condition. Under ocean wave conditions, with the float diameters presently anticipated, the ballast section lengths required to yield a critical condition would far exceed the limits imposed by bending strength, handling and logistics. Therefore, it can be concluded that D/B ratio does not present a realistic design restraint on the tethered float breakwater except for smaller scale applications. (NOAA)

EVALUATION OF IN SITU SHEAR WAVE VELOCITY MEASUREMENT TECHNIQUES,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
A. Viksne.
Report REC-ERC-76-6, April 1976. 40 p, 30 fig, 29 ref.

Descriptors: *Shear, Structural analysis, Borehole geophysics, *Dynamics, Earthquakes, Earth dams, Field tests, Test procedures, *Instrumentation, Elastic properties, Measurement, Embankments, *Seismic properties, Bibliographies.
Identifiers: Borehole probe, *Shear waves.

Several geophysical methods used by the Bureau of Reclamation to obtain the in situ shear wave velocity of earth embankments were evaluated. In situ low-strain shear wave velocity determinations have been performed on a number of existing zoned earthfill dams and an earth dam under construction. These field measurements of shear wave velocity by geophysical exploration methods have become an integral part and standard procedure at the Bureau for obtaining input parameters for dynamic analyses of earth dams. In the course of shear wave velocity measurements, various borehole methods, such as downhole, crosshole, and uphole, as well as seismic refraction have been used. Shear wave velocity measurements have been performed with explosive and nonexplosive impulsive energy sources using cased and uncased test holes. The results of these field studies have not only provided input parameters for dynamic analyses, but have also provided information as to which method or combination of methods should be used to obtain optimum results. Test methods and results of the various in situ measurements are compared and evaluated. (Bur of Reclam)
W77-00737

DESIGN AND PERFORMANCE OF ROCK REVETMENT TOES,
Army Engineer District, Kansas City, Mo. Hydrologic Engineering Branch.
W. M. Linder.
In: Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976; Denver, Colorado, March 22-25, 1976. Water Resources Council, Washington, D.C., Sedimentation Committee, p 2-168 - 2-179, 1976. 5 fig, 1 tab, 1 ref.

Descriptors: *Riprap, *Erosion control, *Model studies, *Bank protection, Retaining walls, Rocks, Bank stabilization, Lakes, Rivers, Shore protection, Structures, Engineering structures, Erosion, Waves(Water), On-site investigations.
Identifiers: *Revetment toes, Rock revetments.

One of the major causes of failure of rock riprap revetments is undercutting or erosion of bank material below the base of the revetment. When this occurs, rock from the side slope migrates downward and exposes areas of unprotected bank, subjecting the entire revetment to progressive destruction. Several model and prototype tests of the performance of various shapes of revetment toes were performed. These investigations were described and conclusions were presented that can be drawn from the studies. The studies indicated that while shape was important, the volume of reserve rock provided in the revetment toe was probably more significant. Rock from a revetment toe generally migrated downward on approximately a 1Vertical on 2Horizontal slope to form a protective layer one to two rock diameters in thickness. Protection continued as long as there was sufficient rock remaining in the toe structure to prevent separation of the side-slope protection. (See also W77-00775) (Sims-ISWS)

LABOR/-TORY AND FIELD INVESTIGATIONS OF NEW MATERIALS FOR ROOF CONSTRUCTION (PROGRESS REPORT),
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
B. V. Jones.
Report REC-ERC-76-4, April 1976. 58 p, 33 fig, 8 tab, 27 ref, append.

Descriptors: Rubber, *Elastomers, Polymers, *Protective coatings, Durability, Laboratory tests, *Performance tests, *Adhesives, *Roofs, Foam, Gravels, *Roofing materials, Silicone.
Identifiers: Rubber sheeting, Neoprene, Butyl rubber.

Materials properties and field performance for sprayed-in-place polyurethane foam and exposed elastomeric membrane roofing systems are presented. Field observations of a styrene foam protected membrane roofing system are discussed and system principles are reviewed. Studies of polyurethane foam systems include: effect of standing water and water vapor, freeze-thaw, system flammability, weathering and impact resistance of protective coatings, and preliminary correlation between impact test results and hail damage. Studies of exposed elastomeric membrane systems include physical properties tests, weathering, and rubber sheet-insulation board strength characteristics. Proposed criteria fo USBR roofing are presented. The sprayed-in-plac polyurethane foam and the styrene foam protecte membrane systems were found to meet th proposed criteria with the latter preferred whe design limitations will allow its use. INFLUENCE OF THE SUPRAMOLECULA MARINE ENVIRONMENT ON PITTING CO ROSION,
Texas A and M Univ., College Station. Ocean E gineering Program.
D. B. Harris, B. M. Gallaway, and J. B. Herbich.
Sea Grant Report No. TAMU-SG-76-211, Augu 1976. 49 p, 7 fig, 30 ref. Also as COE Report N 192. SG-04-5-158-19.

Descriptors: *Corrosion, *Microorganism *Pitting(Corrosion), *Halogens, Ions, Meta Estuarine environment.
Identifiers: Protista, *Pit nucleation, Passi films.

A mechanism is proposed for the process of cor sion pit nucleation in the marine environme Rupture of the passive film is described in terms its sensitivity to attack by negatively hydrat ions. A corollary is suggested which describes t inhibiting effect of various positively hydrat ions. The role of marine microorganisms discussed as it relates to those environmen modifications that may contribute to pit nucle tion. (NOAA)

is report of the Committee on Water Resources esearch (COWRR) of the Federal Council for ience and Technology (FCST) is the Commit-e's periodic statement on the status of water sources research in the Federal Government. e period covered is two years 1973 and 1974, th agency program reports presented on a calen-r year basis and budget information on a fiscal ar basis. The last published Committee report as the Federal Water Resources Research Pro-am for 1971. The report for 1972 was not blished but is availabl from the National Techni-l Information Service, Springfied, Virginia 161 as PB 232 193. The water resources research ogram of each agency of the Government con-rned with water is reported individually. A table ts the total water resources research expendi-res by agency under the 10 FCST-COWRR tegories. In addition those expenditures are mmarized by categories and by agencies in tabu-format.

e fiscal year 1976 budget of the Minnesota ater Resources Research Center was $271,079. e Center supported 9 research projects involv-g 9 faculty members. These research projects ere concerned with: developing a water sources research plan for Minnesota; developing dices for establishing water supply quality status d trends in Minnesota; analyses of organic car-n as a pollution index in Minnesota; bio-manipu-ion of Minnesota lakes for elimination of blue-een algae; social dimensions of water quality atus and trends in Minnesota; assessment of ater quality status and trends in Minnesota by mote sensing techniques; feasibility of using on-ore overburden material as a media for sposal of secondary sewage effluent in rtheastern Minnesota; effects of silt and turbidi-from agricultural drainage on benthic inver-brates in streams in western Minnesota; and ef-cts of drainage projects on surface runoff from etland topography of the North Central Region. bout 30 students received employment through e Center's program. During fiscal year 1976, ere were 18 reports generated through research ojects. (Waelti-Minnesota)

ST OF PAPERS, 1967/1975, NTERNATIONAL ASSOCIATION FOR YDRAULIC RESEARCH).
ternational Association for Hydraulic Research, elft (Netherlands).
ril 1976. 173 p, 4 append.

Descriptors: *Publications, *Bibliographies, *Hydraulics, Fluid mechanics, Research and development, Hydraulic models, Model studies, Hydrometry, Instrumentation, Measurement, Geographical regions, Water utilization, Mathematics, Information retrieval.

Listed were 2,090 papers presented at the biennial congresses and the various symposia of the International Association for Hydraulic Research (IAHR) from 1967 through 1975. The publication was divided into four Appendixes. Appendix I listed the papers in date sequence, arranged in alphabetical order by the names of the individual authors. The various papers were divided into 9 main groups of hydraulic subjects. Each main group was then subdivided into ten more groups. Appendix II listed the 9 main groups and their subgroups. The papers were listed alphabetically by author in Appendix III. In Appendix IV, the papers belonging to the various groups shown in Appendix II were listed. Also included was a list of publications available from IAHR. (Froehlch-ISWS)

ORGANIC LOADING
Municipal Phosphorus Loadings to Lake Erie, an Evaluation Study Prepared for the Great Lakes Water Quality Board.
W77-00926 5B

ORGANIC MATTER
Grown Organic Matter as a Fuel Raw Material Resource,
W77-00700 3F

ORGANIC WASTES
Treatment of Aqueous Waste Solution,
W77-00694 5D

Removal of Organics from Water,
W77-00924 5D

Garbage Pollution, Disposal into Streams.
W77-00990 6E

ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT
Paying to Pollute.
W77-00972 5G

ORGANISMS
Investigations into the Vertical Distribution of Organisms and Chemical Substances in the Groundwater in Valleys and Terraces: Methods and first Results, (In German),
W77-00919 5A

ORTHOPHOSPHATES
Process for Reducing Dissolved Inorganic Orthophosphates to PPB Levels in Aqueous Systems,
W77-00685 5G

OSCILLATORY FLOW
Forces on a Rough Bed in Oscillatory Flow,
W77-00650 2L

OUTER CONTINENTAL SHELF
Environmental Assessment of the Alaskan Continental Shelf. Volume 1. Marine Mammals.
W77-00901 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 2, Marine Birds.
W77-00902 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 3. Marine Birds.
W77-00903 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 4. Marine Birds.
W77-00904 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 5. Fish, Plankton, Benthos, Littoral.
W77-00905 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 6. Fish, Plankton, Benthos, Littoral.
W77-00906 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 7. Fish, Plankton, Benthos, Littoral.
W77-00907 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 8, Effects of Contaminants.
W77-00908 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 9. Chemistry and Microbiology.
W77-00909 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 10. Chemistry and Microbiology.
W77-00910 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume II. Physical Oceanography and Meteorology.
W77-00911 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 12. Geology.
W77-00912 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 13. Geology.
W77-00913 6G

Environmental Assessment of the Alaskan Continental Shelf. Volume 14. Ice.
W77-00914 6G

OUTLET WORKS
Hydraulic Model Studies of Navajo Dam Auxiliary Outlet Works and Hollow-Jet Valve Bypass--Modifications to Reduce Dissolved Gas Supersaturation,
W77-00739 8C

OUTLETS
Storm Runoff Routing to a Tidal Outfall: A Case Study,
W77-00952 4A

OVERFLOW
Computerized City-Wide Control of Urban Stormwater,
W77-00634 5G

OVERLAND FLOW
The Nonpoint Source Pollutant Loading (NPS) Model,
W77-00617 5B

OVERPOPULATION
Carrying Capacity Prototype Investigations in the State of Hawaii, Summary Report,
W77-00917 6G

OXIDATION
Precision Aquarator Speeds COD Determination,
W77-00605 5A

Wet Air Oxidation of Alkaline Pulp Liquors.
W77-00753 5D

Removing Iron from Acid Waste Liquids by Oxidation - at Controlled PH by Addition of Base, Giving Easily Separated Precipitation for Large-Scale Use.
W77-00761 5D

Evaporation and Thermal Oxidation of Liquid Effluents - by Burning with Flame in Combustion Chamber.
W77-00765 5D

OXIDATION LAGOONS
Infiltration Lagoons for Tertiary Treatment of Stabilization Pond Effluent,
W77-00540 5D

Disinfection Kinetics of Algal-Bacterial Systems,
W77-00595 5D

OXIDATION-REDUCTION POTENTIAL
Interrelationships Between Certain Microorganisms and Some Aspects of Sediment-Water Nutrient Exchange in Two Bayou Estuaries, Phases I and II,
W77-00674 5C

The Sediments of Lake George (Uganda). Redox Potentials, Oxygen Consumption Carbon Dioxide Output,
W77-00712

OXYGEN
Effects of Environmental Factors Photosynthesis Patterns in Phaeodactyl Tricornutum (Bacillariphyceae). II. Effect Oxygen,
W77-00721

OXYGEN DEMAND
The Sediments of Lake George (Uganda) Redox Potentials, Oxygen Consumption Carbon Dioxide Output,
W77-00712

OXYGEN DEPLETION
Interrelationships Between Certain Micr ganisms and Some Aspects of Sediment-W Nutrient Exchange in Two Bayou Estua Phases I and II,
W77-00674

OXYGENATION
Double Funnel Device for Oxygena Sewage,
W77-00565

OYSTER SEED BEDS
Oyster Setting and Early Spat Survival at C cal Salinity Levels on Natural Seed Oy Beds of Delaware Bay,
W77-00676

OYSTERS
Oyster Setting and Early Spat Survival at C cal Salinity Levels on Natural Seed Oy Beds of Delaware Bay,
W77-00676

Relationship of Vibrio Parahaemolyticus Oysters, Water, Sediment, and Bacteriolo and Environmental Indices,
W77-00877

Marine Resources Commission--Oy Grounds--Use of Subaqueous Lands for C struction and Maintenance of Sewage Disp Facilities.
W77-01015

OZONATION
Ozonation of Ammonia in Wastewater,
W77-00553

OZONE
Ozonation of Ammonia in Wastewater,
W77-00553

PACIFIC NORTHWEST U. S.
The Universal Soil Loss Equation as Ada to the Pacific Northwest,
W77-00804

PACIFIC OCEAN
Finestructure and Microstructure Observat During the Passage of a Mild Storm,
W77-00653

A Cyclesonde View of Coastal Upwelling,
W77-00654

Seasonal Shifts in the Spawning Site Northeast Pacific Intertidal Fish,
W77-01063

PACIFIC SLOPE BASINS (CALIF)
Surface Water Supply of the United St 1966-70: Part II. Pacific Slope Basins in Cali

a--Volume 2. Basins from Arroyo Grande to regon State Line Except Central Valley.
77-00857 7C

CKED-BED REACTORS
acked-Bed Reactors for Nitrification and enitrification of Secondary Effluents,
77-00733 5D

NT
ffluent Treatment in the Paint and Surface oating Manufacturing Industry,
77-00764 5D

EOLIMNOLOGY
ediment Characteristics and the Trophic atus of Four Oregon Lakes,
77-00673 5B

ACALLIOPE-FLUVIATILIS
oxicity of Paraquat to Paracalliope Fluviatilis Amphipoda),
77-00666 5C

AGONIMUS-MIYAZAKII
udies on the Incidence of Encysted Larvae of aragonimus Mivazakii Kamo Et Al, 1961 in e Crab Potamon Dehaani in Shizuoka Prefecre, Japan, (In Japanese),
77-01036 5C

ANA RIVER (ARGENTINA)
ydrochemistry of the Parana River,
77-00644 2K

AQUAT
oxicity of Paraquat to Paracalliope Fluviatilis Amphipoda),
77-00666 5C

fluence of Water Treated Artificially with erbicides on Honey Bee Colonies,
77-00689 5C

IA RIVER
hannel Changes in the Colorado River Below len Canyon Dam,
77-00832 2J

KER DAM (ARIZ)
ediment Control at Imperial Dam,
77-00802 4D

RTIAL GRADIENTS (ESTIMATION)
ole of Partial Gradient Estimation by Simulaon in Water Resource Plan Formulation, Part
77-00533 6A

RTICIPATING FUNDS
nternational Joint Ventures in Fishing and 200-Mile Economic Zones,
77-00707 6E

TENTS
ggregation Treatment Apparatus for Waste Water,
77-00560 5D

ewage System,
77-00561 5D

lectrocoagulation System for Removing Pollunts from Wastewater,
77-00562 5D

ank Clarification Plant,
77-00563 5D

ludge Elevator for Fluid Clarification System,
77-00564 5D

Double Funnel Device for Oxygenating Sewage,
W77-00565 5D

Method of Treating Waste Water,
W77-00566 5D

Process and Apparatus for Treating Wastes by a combined Activated Sludge and Biological Filter Bed,
W77-00567 5D

Emulsion Polymerization of Cationic Monomers,
W77-00568 5D

Sewage System with Reusable Flush Medium,
W77-00569 5D

Apparatus for Aerobic Decomposition of Sewage,
W77-00570 5D

Treating Polluted Water.
W77-00571 5D

Treatment of Sewage.
W77-00572 5D

Decanting Waste Water.
W77-00573 5D

Method of Wastewater Treatment,
W77-00574 5D

Phosphorus Removal from Waste Water.
W77-00575 5D

Method for Improving Sewage Sludge Incineration,
W77-00576 5E

Apparatus for Treatment of Aqueous Sewage Composition,
W77-00577 5D

Treating Sewage and Recovering Usable Water and Solids,
W77-00578 5D

Process for Removing Dispersed Matter from Water,
W77-00684 5G

Process for Reducing Dissolved Inorganic Orthophosphates to PPB Levels in Aqueous Systems,
W77-00685 5G

Scale Inhibition and Compounds Therefore,
W77-00686 5F

Removal of Contaminants from Water,
W77-00687 5G

Portable Water Sterilization Device,
W77-00688 5F

Gravity Clarifier,
W77-00690 5D

Wave Generator,
W77-00691 8C

Power Generating Machine Actuated by Ocean Swells,
W77-00692 8C

Treating Waste Discharge Liquids from Metal Hardening Baths, Particularly Containing Nitrite and Nitrate Compounds,
W77-00693 5D

Treatment of Aqueous Waste Solution,
W77-00694 5D

Process for the Treatment of Waste Water from a Fiberglass Manufacturing Process,
W77-00695 5D

Method and Apparatus,
W77-00696 5D

Effluent Treatment,
W77-00697 5D

Liquid Treatment Apparatus,
W77-00699 5D

Purification of Industrial Waste Water - Having High Concentration of Dissolved Solids by Treatment with Strong Acids or Bases to Give Fertilisers and Feed Additives.
W77-00743 5D

Wet Air Oxidation of Alkaline Pulp Liquors.
W77-00753 5D

Zinc Removal from Viscose Plant Effluent - by Extraction with Alkyl Phosphoric Acid into an Organic Solvent and Re-Extraction Decomposition Therefrom.
W77-00756 5D

Removing Iron from Acid Waste Liquids by Oxidation - at Controlled PH by Addition of Base, Giving Easily Separated Precipitation for Large-Scale Use.
W77-00761 5D

Evaporation and Thermal Oxidation of Liquid Effluents - by Burning with Flame in Combustion Chamber.
W77-00765 5D

PATH OF POLLUTANTS

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.

- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 10, NUMBER 3
FEBRUARY 1, 1977

The Library of the
MAR 7 1977
University of Illinois
Urbana-Champaign

W77-01051 -- W77-01550
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 10, NUMBER 3
FEBRUARY 1, 1977

W77-01051 -- W77-01550

etary of the U.S. Department of the Interior has de-
that the publication of this periodical is necessary in the
on of the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

elected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent nographs, journal articles, reports, and other publication mats. The contents of these documents cover the water-ated aspects of the life, physical, and social sciences as ll as related engineering and legal aspects of the charac-stics, conservation, control, use, or management of water. ch abstract includes a full bibliographical citation and a set descriptors or identifiers which are listed in the **Water sources Thesaurus.** Each abstract entry is classified into fields and 60 groups similar to the water resources re-arch categories established by the Committee on Water sources Research of the Federal Council for Science and chnology.

RSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE OPIES OF DOCUMENTS ABSTRACTED IN THIS JOUR-L. Sufficient bibliographic information is given to enable aders to order the desired documents from local libraries other sources.

lected Water Resources Abstracts is designed to serve scientific and technical information needs of scientists, gineers, and managers as one of several planned services the Water Resources Scientific Information Center RSIC). The Center was established by the Secretary of the erior and has been designated by the Federal Council for ience and Technology to serve the water resources com-nity by improving the communication of water-related search results. The Center is pursuing this objective by co-dinating and supplementing the existing scientific and tech-al information activities associated with active research d investigation program in water resources.

provide WRSIC with input, selected organizations with tive water resources research programs are supported as enters of competence" responsible for selecting, abstract-ing, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

tifiers: *Standford Watershed Model, ntucky Watershed Model, *Ottawa River ershed(Ohio).

metric watershed models, such as the Ken-y Watershed Model, have been used satisfac-y for simulating the hydrology of agricultural rsheds. With the addition of a divergent flow outing to account for direct waste discharges pumpages by municipal and industrial ces, these models can be used to predict the cts of urbanization. Utilization of the percent rvious area parameter for reflecting the ee of urban influence within the watershed been shown to be a valid approach. This od can also be used in regional planning, n information is needed concerning effects on watershed hydrology from urban growth. Ur-zation effects on the hydrologic response of Ottawa River watershed in Ohio were in-gated with the modified parametric model. gh-ISWS)

criptors: Hydrography, Rain gages, Rainfall-ff relationships, *Design flood, *Synthetic ology, *Rainfall intensity, *Precipitation ex-

tifiers: South Africa.

s of several routing procedures for hydrog-y synthesis revealed that routing of the excess hyetograph through a single linear reservoir-storage could yield a plausible direct runoff ograph provided the shape and drainage pat-of the catchment was not abnormal. The od requires evaluation of only one parameter, outing constant K, to define the hydrograph n excess rain of given depth and duration. K es were determined for 92 South African nments by seeking best-fits between routed observed unitgraphs. To aid estimation of K ngauged catchments the country was subdi-d into veld-type zones for each of which a relationship between K and area of catchment is provided. A worked example demonstrates the method. (South Africa)

A STUDY OF HOURLY RAINFALL DISTRIBUTION AROUND MONSOON DEPRESSION CENTRE IN CENTRAL INDIA,
Regional Meteorological Center, Nagpur (India).
K. S. Venkataraman, A. Chowdhury, and A. K. Banerjee.
Indian Journal of Meteorology and Geophysics, Vol. 25, No. 2, p 239-244, April 1974. 5 fig, 2 ref.

Descriptors: *Rainfall, *Rainfall disposition, *Distribution patterns, *Asia, Precipitation intensity, Precipitation(Atmospheric), Rain, Monsoons, Rainfall intensity, Data processing, Depression, Storms, Meteorology.
Identifiers: *India, *Madhya Pradesh(India).

Average distribution of rainfall around the center of monsoon depression in separate intervals of six hours in central India was presented and discussed in this paper. The following observations were made: The area around the first 100 km of the depression center is generally free from intense rainfall activities. The heavy rainfall belt is mostly confined to the left forward quadrants of the depression field, and rainfall is most widespread in these quadrants in the third and fourth six-hour intervals, reckoned with 03 GMT. Hourly intensities of rainfall greater than 50 mm/hr, however, are more frequent during the first 6-hr interval. (Sims-ISWS)
W77-01125

DIURNAL VARIATION OF RAINFALL IN BRAHMAPUTRA VALLEY,
Meteorological Office, Nasik (India).
B. Prasad.
Indian Journal of Meteorology and Geophysics, Vol. 25, No. 2, p 245-250, April 1974. 7 tab, 5 ref.

Descriptors: *Rainfall, *Rainfall disposition, *Diurnal, *Asia, Mountains, Valley, Precipitation(Atmospheric), Precipitation intensity, Rain, Rainfall intensity, Meteorology.
Identifiers: *India, *Brahmaputra Valley(India).

A study was done of the diurnal variation of rainfall at four stations within the Brahmaptura Valley. The mean hourly monthly rainfall at the four stations was considered. It was found that a well marked diurnal variation in the rainfall exists with the maximum in the early morning hours and the minimum in the afternoon hours. It was argued that this is mainly due to the mountain winds. (Sims-ISWS)
W77-01126

A STUDY OF MAXIMUM VALUES OF WITHIN-STORM RAINFALL,
Meteorological Office, New Delhi (India).
P. S. Harihara Ayyar, and N. Tripathi.
Indian Journal of Meteorology and Geophysics, Vol. 25, No. 2, p 251-255, April 1974. 1 fig, 5 tab, 2 ref.

Descriptors: *Rainfall, *Design storm, *Probable maximum precipitation, *Asia, Duration curves, Statistics, Precipitation(Atmospheric), Excessive precipitation, Rain, Precipitation intensity, Rainfall intensity, Storms, Design flood, Weather data, Climatic data, Meteorology, Climatology.
Identifiers: *India.

It has been observed by hydrologists that the maximum flood peaks are generally produced by storms of long duration containing high intensity spells, whereas only low flood peaks are produced by short duration storms though the rainfall intensity in the storms may be higher. Hence it is advisable to take the design rainfall value of the required duration and frequency computed from the within-storm rainfall values. Design engineers often require adjustment factors for converting the among-storm rainfall value to within-storm rainfall value. For this purpose, depth-transformation curves for a 2-year return period for the Indian region were compiled and presented. For return periods of 25 years and above, the adjustment factor was found to be nearly 1.0. (Sims-ISWS)
W77-01127

DYNAMICAL ABNORMALITIES ASSOCIATED WITH DROUGHT IN THE ASIATIC SUMMER MONSOON,
Institute of Tropical Meteorology, Poona (India).
R. N. Keshavamurty, and S. T. Awade.
Indian Journal of Meteorology and Geophysics, Vol. 25, No. 2, p 257-264, April 1974. 6 fig, 1 tab, 12 ref.

Descriptors: *Droughts, *Monsoons, *Asia, Circulation, Air circulation, Precipitation(Atmospheric), Rainfall, Temperature, Air temperature, Water shortage, Meteorology, Climatology.
Identifiers: *India.

In the recent past, 1965 and 1972 were years of severe drought over India. The dynamical and thermal features of those years were contrasted with the features of a normal monsoon season. The main local abnormality during drought years is the shift of the monsoon trough northwards and development of aticyclones over central India in the lower troposphere. The main abnormality in the thermal field is that temperatures are considerably below normal over southern parts of USSR, Iran, Afghanistan, and north India. Quasi-geostrophic 'omega' was used to delineate the vertical circulations. It was seen that the north-south circulation and associated energy conversion were weaker and the east-west circulation more marked during breaks. A model of the vertical circulations during drought periods was suggested. The intensity, phase, movement, and vertical and horizontal tilts of the different wave numbers in the mid-latitudes during drought and in the preceding months were contrasted with the normal conditions. In 1972, wave Nos. 5-9 were abnormally pronounced and showed some dynamical differences. (Sims-ISWS)

THE STUDY OF DROUGHTS BY WATER BUDGET METHOD OVER ANDHRA PRADESH,
Institute of Tropical Meteorology, Poona (India).
P. Rakhecha.

Indian Journal of Meteorology and Geophysics, Vol. 25, Nos. 3 and 4, p 411-416, July and October 1974. 6 tab, 5 ref.

Descriptors: *Droughts, *Climatology, *Water balance, Hydrologic budget, Evapotranspiration, Arid climates, Arid lands, Moisture deficit, Water shortage, Climatic data, Rainfall, Precipitation(Atmospheric), Weather, Meteorology.
Identifiers: *India, *Andhra Pradesh(India)..

Studies of droughts based on water budget method seem to provide a more realistic approach than studies based on rainfall alone. The frequency and pattern of variation of the drought situations for a group of 9 stations in Andhra Pradesh during the last 70 years were studied by computing aridity indices values from water balance considerations of Thornthwaite. From this study, it was seen that a minimum of 3-4 effective drought years may be expected over each station in a decade and that liability to drought is maximum in Nellore. An examination of the year-to-year changes in climate showed that the disastrous drought years generally became arid in nature. (Sims-ISWS)
W77-01130

GENERALIZED RELATIONSHIP BETWEEN MAXIMUM RAIN DEPTH, AREA AND RETURN PERIOD FOR MAJOR RAINSTORMS,
Institute of Tropical Meteorology, Poona (India).
O. N. Dhar, and P. Rakhecha.
Indian Journal of Meteorology and Geophysics, Vol. 25, Nos. 3 and 4, p 417-422, July and October 1974. 3 fig, 3 tab, 11 ref.

Descriptors: *Depth-area-duration analysis, *Rainfall, *Probable maximum precipitation, Analytical techniques, Depth-area curves, Duration curves, Rainfall intensity, Frequency, Storms, Meteorological data, Meteorology, Climatology.
Identifiers: *Tropical storms, *India, *Bihar region(India).

A generalized relationship among maximum rain depth, area, and return period was determined using Karoly and Alexander technique. For this purpose, major rainstorms which affected Bihar region during the 65-year period from 1897 to 1961 were analyzed, and their depth-area-duration data utilized. The 3-day relationship was found to be of the form d = -2.76 log A log T -4.08 log A + 16.03 log T + 23.73. Based on this relationship, a monogram was prepared with which maximum 3-day rain depths could be obtained for different areas and return periods. Conversion factors were also worked out for obtaining maximum rain depths for one and two-day durations for different areas and return periods. (Sims-ISWS)
W77-01131

THE RESULTANT DIRECTION AND INCLINATION OF RAINFALL AT TAITA EXPERIMENTAL STATION, NEW ZEALAND,
Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Soil Bureau.
R. Aldridge.
Journal of Hydrology (New Zealand), Vol. 14, No. 1, p 42-54, 1975. 10 fig, 1 tab, 11 ref.

Descriptors: *Rainfall, *Precipitation(Atmospheric), Winds, Data processing, Measurement, On-site investigations, Data collections, Monthly, Seasonal, Annual, *Rain gages.
Identifiers: *New Zealand, Vectopluviometers, Inclined rainfall, Rainfall direction.

Resultant direction and inclination of rainfall at Taita Experimental Station, Lower Hutt, New Zealand, have been computed from vectopluviometer data for the period March 1959 to December 1971. The patterns of distribution of resultant direction and inclination were described in relation to selected daily-rainfall size classes. The relationship between resultant direction and inclination of daily rainfall was related to daily and monthly windrun data. Monthly, seasonal, and annual variations of resultant direction and inclinations were described. Resultant directions of rainfall over long periods showed peaks between 200 deg and 280 deg and between 320 deg and 020 deg with the largest peak, between 200 deg and 240 deg, corresponding approximately to the orientation of the lower Hutt Valley. About 40% of the daily rainfall fell at inclinations less than 11 deg from the vertical, and about 60% at less than 21 deg. Low or high inclination of rainfall may broadly be associated with low or high windrun. Northerly and westerly exposures received the largest proportion of the rainfall, and easterly exposures the smallest. Generally, spring and summer months had the largest northerly rainfall components, and autumn the largest southerly and westerly components. Winter had the largest easterly rainfall component while retaining a large southerly component. (Sims-ISWS)
W77-01133

THE RESULTANT DIRECTION AND INCLINATION OF RAINFALL AT ARAHURA, WAIRARAPA, NEW ZEALAND,
Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Soil Bureau.
R. Aldridge.
Journal of Hydrology (New Zealand), Vol. 14, No. 1, p 55-63, 1975. 7 fig, 1 tab, 5 ref.

Descriptors: *Rainfall, *Precipitation(Atmospheric), *Rain gages, Winds, Data processing, Measurement, On-site investigations, Data collections, Monthly, Seasonal, Distribution, Rainfall disposition.
Identifiers: *New Zealand, Vectopluviometers, Inclined rainfall, Rainfall direction.

Resultant directions and inclinations of rainfall have been computed from vectopluviometer data taken at Arahura near Gladstone in the Wairarapa, for the period June 1967 to July 1971. The distribution of resultant direction and inclination of the daily rainfall was discussed along with the relationship between resultant direction and inclination. Monthly and seasonal variations of the resultant direction and inclination of the rainfall were presented. This study illustrated the marked predominance of southerly rainfall in this part of the Wairarapa and the rarity of northerly or westerly rainfall. Resultant inclinations of the rainfall showed that the southerly rainfall is more steeply inclined from the vertical than rainfall from other directions. (Sims-ISWS)

THE INTERPRETATION OF RAINFALL PA TERNS IN NORTHERN YUCATAN UTILIZIN METEOROLOGICAL SATELLITE IMAGERY,
University of South Alabama, Mobile.
A. Williams.
Association of American Geographe Proceedings, Vol 8, p 15-19, 1976. 4 fig, 7 ref.

Descriptors: *Rainfall, *Meteorological da *Thunderstorms, *Sea breeze *Precipitation(Atmospheric), *Satellites(Artificial), Data collections, Topo raphy, Karst, Air masses, Orography, Clima data, *Mexico.
Identifiers: *Yucatan Peninsula(Mexico).

The relationship between the thunderstor anomalous rainfall pattern of the Karst Plain of t Yucatan Peninsula and the use of weather satell imagery to assist in establishing this relationsh are discussed. Conventional climatological da for Yucatan are inadequate. Thus, satell imagery is utilized. The maximum rainfall anoma of the northeast Karst Plain results from the co vergence of two sea breezes, one from the Gulf Mexico, one from the Caribbean. This 'double breeze effect' creates an area of intense conv gence and the subsequent development of n merous thunderstorms resulting in 40 inches more of rainfall a year. Without the assistance satellite imagery, the documentation of this eve would have been possible only with extensive s face instrumentation. The northwest coast of Y catan is more arid than the eastern portion, aver ing from 15 to 30 inches of rainfall per year. T entire peninsula shares a dry winter, thus summ atmospheric circulation accounts for the d ference. The conclusion is that a single sea bree inhibits thunderstorm development along t northwest coast and therefore contributes to semi-arid climate. (Jamail-Arizona)
W77-01280

RAINFALL AND FLOODS IN INDIA DURI 1973 SOUTHWEST MONSOON PERIOD,
Meteorological Office, New Delhi (India).
S. D. S. Abbi, M. R. Nagasubramanian, and B. C Jain.
Indian Journal of Meteorology and Geophysi Vol. 25, Nos. 3 and 4, p 363-370, July and Octob 1974. 2 fig, 3 tab.

Descriptors: *Rainfall, *Climatic da *Monsoons, Precipitation excess, Floo Weather data, Meteorological data, Precipi tion(Atmospheric), Depth-area curves, Rainfall tensity, Excessive precipitation, Isohyets, C matology, Meteorology.
Identifiers: *India.

Rainfall during the 1973 southwest monso period was more or less normal over the count It was in excess in Punjab, Jammu and Kashm Rajasthan, west Madhya Pradesh, and Gujarat R gion. Rainfall was deficient only over coastal An hra Pradesh where it was -27%. The characteris feature of the 1973 monsoon period was the occ rence of excessive rainfall in west Rajasthan a west Madhya Pradesh in August, leading to se ous floods. The percentage departures of t southwest monsoon rainfall week-by-week in t

meteorological subdivision of India were given. e progress of the monsoon from 1 June depict- the percentage departures from normal of the nulative rainfall for the successive weeks was ulated. Also, the salient features of the rainfall tribution were presented. (Sims-ISWS)

OWMELT LYSIMETERS PERFORM WELL COLD TEMPERATURES IN CENTRAL LORADO,
est Service (USDA), Fort Collins, Colo. Rocky untain Forest and Range Experiment Station.
W. Schultz.
Research Note RM-247, September 1973, 8 p, 8 fig, 9 ref.

Descriptors: *Lysimeters, Snow management, *Snowmelt, *Colorado, Temperature, Measurement, Instrumentation.

Comparison between lysimeter and snow-tube measurements of melt rates indicated that the lysimeters provided reliable measurements of snowmelt. The lysimeter frame did not noticeably affect the thermal regime of the snow within the lysimeter. (Forest Service)

THE MEASUREMENT OF WATER LOSSES FROM A FORESTED AREA USING A 'NATURAL' LYSIMETER,
Institute of Hydrology, Wallingford (England).
I. R. Calder.
Journal of Hydrology, Vol. 30, No. 4, p 311-325, 1976. 7 fig, 2 tab, 12 ref.

Descriptors: *Lysimeters, *Water loss, *Forests, *Evaporation, Interception, Transpiration, Forest management, Runoff, Water balance, Soil moisture, Rainfall, On-site investigations.
Identifiers: *Natural lysimeter, *Forested area, *Wales, *Potential evaporation, *Forest canopy, *Upper Severn River, Catchment, Field measurement, Water balance equation.

Water losses due to transpiration and evaporation of intercepted water were measured using a 'natural' lysimeter in the Hafren forest of central Wales. Then, they were compared with estimates of potential evaporation calculated from meteorological observations. Given certain assumptions concerning the forest canopy, the lysimeter observations were used to estimate runoff from the experimental catchment of the Upper Severn, within which the lysimeter was sited. This estimate agreed well with the observation. The annual loss recorded at the lysimeter, amounting to twice Penman E sub o, demonstrated the magnitude of the evaporation losses that arise from forests in a high-rainfall area. The total losses estimated for the Severn experimental catchment as a whole were significantly less, owing to the relatively small percentage of the total catchment area with canopy coverage and the consequent reduction in the interception loss. Interception was a major loss component in this high-rainfall area and underlined the need for accurate methods of measuring and predicting interception losses from similar areas. (Roberts-ISWS)

WATER SALVAGE POTENTIALS IN UTAH, VOLUME II, EVAPORATION SUPPRESSION BY RESERVOIR DESTRATIFICATION,
Utah Water Research Lab., Logan.
T. C. Hughes, E. A. Richardson, and J. A. Franckiewicz.
Report No. PRWA22-2, June 1975. 84 p, 21 fig, 16 tab, 32 ref, 9 append.

Descriptors: *Water quality control, *Evaporation, *Reservoirs, *Destratification, *Temperature, Cooling, *Utah, Regression analysis, Costs, Estimating, Environment, Benefits, Hypolimnion, Conservation, River basins, Research, Mixing, Mathematical models, Systems analysis, Forecasting.
Identifiers: *Suppression model, Mechanical pumping, Compressed air, *Water salvage.

A model is developed for predicting evaporation suppression due to the surface cooling effect of reservoir destratification. The model is based upon measured temperature profiles at a sample of ten Utah reservoirs. Regression analysis is then used to extend the results to all other deep reservoirs in Utah. Both suppression amounts and costs are estimated for each reservoir. The use of thermal mixing by either mechanical pumping or compressed air appears to have important potential for evaporation suppression on deep reservoirs. This concept does not involve many of the problems associated with monolayer suppression. It is independent of wind; it does not produce a concentration of excess heat near the surface; it provides a mechanism for net suppression on an annual rather than only a seasonal basis (warmed outflow); and it does not involve environmental problems associated with adding chemicals to the reservoir surface. There are, in fact, several environmental benefits claimed for the destratification procedure. Significant improvement in dissolved oxygen (DO), taste and odor, algae production, and many other quality parameters occur in the hypolimnion water. In addition to these human related benefits, fish habitat may be improved both in the reservoir (because of increased DO) and downstream from it. A major potential for water conservation in general and water energy production and salinity control in particular exists at Lake Powell. (Bell-Cornell)

EVAPORATION MEASUREMENTS WITH A SELF-RECORDING EVAPORIGRAPH,
Meteorological Office, Poona (India).
S. K. Shaha, P. S. Batar, and R. R. Kelkar.
Indian Journal of Meteorology and Geophysics, Vol. 25, Nos. 3 and 4, July and October 1974. 5 fig, 1 tab, 3 ref.

Descriptors: *Evaporation, *Evaporimeters, *Measurement, *Statistics, Evaporation pans, Water loss, On-site investigations, Diurnal, Instrumentation, Rates, Data processing, Climatology.
Identifiers: *India, *Evaporigraph.

Data collected over five years (1967-71) with a self-recording evaporigraph at the Central Agricultural Meteorological Observatory in Poona, were analyzed and discussed. The afternoon three-hour period 1330-1630 IST was found to contribute as much as 24 to 30% of the total daily evaporation recorded in any month; whereas the fifteen-hour period 1930-1030 IST accounted for only 26 to 41% of the total daily evaporation. A statistical analysis of evaporigraph data in comparison with Class A Pan evaporimeter measurements was also presented. (Sims-ISWS)

AN EVAPORATION EQUATION FOR AN OPEN BODY OF WATER EXPOSED TO THE ATMOSPHERE,
Auburn Univ., Ala. Dept. of Mechanical Engineering.
J. S. Goodling, B. L. Sill, and W. J. McCabe.
Water Resources Bulletin, Vol. 12, No. 4, p 843-853, August 1976. 3 fig, 10 ref.

Descriptors: *Evaporation, *Forced drying, *Wind velocity, Temperature, Air, Heat flow, Winds, Mass transfer, Equations, Air temperature, Numerical analysis, Mathematical studies.
Identifiers: *Natural evaporation, *Forced evaporation, Evaporation equation, Evaporative heat flux, Lake stratification, Cooling ponds, Mass transport.

Evaporation was identified as having two additive components: natural evaporation in the absence of wind, and forced evaporation in the presence of wind. An evaporation equation was obtained for an open body of water exposed at the atmosphere by conversion of standard, horizontal flat plate heat transfer relationships to a mass transfer or evaporation equation, based on an average air temperature of 68F. A comparison of numerical values predicted by this equation was made with evaporation equations deduced from field measurements, and the agreement was favorable. The major differences between this equation and those previously developed were: (1) This equation was derived strictly from standard heat transfer expressions, and (2) A dependency of average fetch and air temperature (through transport properties) was shown. This approach established the correct dependencies of the field parameters so that future experimental measurements would have a sound theoretical basis. (Roberts-ISWS)
W77-01338

LEAF DIFFUSION RESISTANCE TO WATER VAPOUR AND ITS DIRECT MEASUREMENT,
Agricultural Univ., Wageningen (Netherlands). Lab. of Physiological Meteorology.
C. J. Stigter, J. Birnie, and B. Lammers.
Meded Landbouwhogesch Wageningen. 73(15), p 1-55, 1973.

Descriptors: *Leaves, *Drought resistance, *Instrumentation, *Measurement, *Evaporimeters, Water vapor.
Identifiers: *Porometer resistance.

The design and calibration of an improved leaf diffusion resistance meter is described. A value for porometer resistance was derived theoretically from geometrical considerations and transport phenomena which was in good agreement with measured values. An accurate measuring procedure was designed using accurate digital indication of charges in sensor resistance. Three fixed electrical resistance values were used to obtain a short and long transient time, the ratio of the 2 making it possible to collect information on the possible influence of the measuring device on the state of opening of the stomata. Descriptors: *Model studies, *Simulation analysis, *Evapotranspiration, *Forest management, *Water yield, Water yield improvement, Transpiration, Interception, Soil-water-plant relationships, Soil moisture, Soil water, Clear-cutting, Reforestation, Vegetation regrowth, Watershed management, North Carolina, Tennessee, Drainage.

Prosper, a phenomenological model of water exchange between soil, plant, and atmosphere, was used to simulate evapotranspiration and annual drainage for 2 years from a mature oak-hickory forest in the southern Appalachians. The simulation was tested by comparing drainage to measured streamflow. In a year of unusually high precipitation the simulated annual drainage was within 1.5% of measured streamflow. Simulations were also performed by using the same 2 years of meteorologic data, but vegetation parameters were changed to represent a young white pine plantation and a regrowing hardwood forest 1 year after clear-cutting. The model estimated that drainage for an average rainfall year was reduced 20 cm by a 16-year-old white pine plantation and increased 36 cm by clear-cutting. These results were comparable to changes of -20 and +38 cm observed in watershed experiments at Coweeta Hydrologic Laboratory. Simulated evapotranspiration during the summer was nearly identical for hardwood and pine forests, while winter and early spring water loss was greater for pine. Simulation suggests that the greater evapotranspiration by pine was due to increased interception in all seasons and increased transpiration in the dormant season. For the clear-cut area, simulated evapotranspiration was considerably less than it was for the pine or hardwood forest and thus caused simulated soil moisture contents to be greater during the summer season. Identifiers: *Surface runoff models, Agricultu basins, Terraced basins, Linear model, Natu agricultural basins, Kinematic wave model.

A comparative assessment of two mathemat models of surface runoff was made by apply them to 21 terraced and unterraced natural agric tural basins located in two geographically differ regions. The models included a nonlinear ki matic wave model based on the converging sect geometry and Nash's linear model (NASH). T criteria for comparison included prediction hydrograph peak, hydrograph peak time and entire hydrograph, and some elementary statist tests. It was shown that converging sect geometry had a tendency to overpredict both p discharge and its time of occurrence, while NA had a tendency to underpredict them. It was s shown that because of its nonlinear charact converging section geometry was more sensit to errors in the input than NASH was. Furth more, one model could not be uniformly be than the other. It was concluded that the choice a particular model depends on the criterion comparison. (Roberts-ISWS)

2F. Groundwater

HYDROGEOLOGY OF THE QUATERNARY AND TERTIARY FORMATIONS ALONG THE SOUTH COAST OF THE ALGARVE PORTUGAL,
Vrije Universiteit, Amsterdam (Netherlands). Inst. of Earth Sciences.
H. Speelman, and H. Ryckborst.
Hydrological Sciences Bulletin, Vol 21, No 2, p 345-356, June 1976. 8 fig, 2 tab, 7 ref.

Descriptors: *Hydrogeology, *Areal hydrogeology, *Aquifers, Groundwater, Coasts, Saline water intrusion, Geology, Wells, Transmissivity, Hydraulic conductivity, Tidal effects, Water levels, Model studies, On-site investigations, Water quality.
Identifiers: *Portugal.

Excessive groundwater withdrawal along the South coast of Portugal threatens the continued existence of the freshwater supply. The heavy pumping of groundwater is induced partly by the spectacular growth of the tourist industry since 1968 and partly by the new irrigation techniques for the citrus industry. In order to assess the present freshwater situation, a study was carried out in which the Quarteira area was selected as a representative zone for the southern part of the Province of Algarve. It was found that the Quaternary and Tertiary deposits on the south coast of Portugal are distinguished by their excellent aquifer characteristics. The transmissivity of the Pleistocene-Pliocene formations reaches a maximum of 1550 sq m/d. In comparison the Miocene deposits are fairly good aquifers with a transmissivity of about 270 sq m/d. Among the Holocene deposits, the barrier dunes show reasonably good water-bearing qualities. The good hydraulic conductivities (19-22 m/d) result in a flat shape of the groundwater table and freshwater flows towards the ocean. Excessive groundwater withdrawal has caused seawater intrusion. The locations of the seawater intrusions correspond with those centers where a spectacular growth of the tourist industry has taken place since 1968, and also with those

areas where new developments in the irrigation techniques for the citrus industry have been applied. On the ocean front where seawater intrusion occurs, the thickness of the freshwater lens has been reduced to 27-32 m. (Sims-ISWS)

Wisconsin Univ., Madison. Dept. of Geology and Geophysics.
M. P. Anderson.
Water Resources Research, Vol. 12, No. 4, p 640-644, August 1976. 7 fig, 24 ref.

Descriptors: *New York, *Groundwater movement, *Model studies, Groundwater, Dupuit-Forchheimer theory, Wells, Hydrographs, Freshwater, Groundwater recharge, Hydrology.
Identifiers: *Ocean Island, *Long Island(NY), Continuously moving interface model, Delayed interface response model, Salt water.

Two one-dimensional models based on the Dupuit-Forchheimer assumptions to simulate flow beneath strip oceanic islands were presented. A model which was here designated the continuously moving interface (CMI) model was solved by finite differences. The solution agreed well with an analytical solution for a particular case given by Collins (1976). Because of its long response time, the CMI model was not able to simulate short-term fluctuations in water level in a well located on the South Fork of Long Island, New York. A second model, designated the delayed interface response (DIR) model, could reproduce the average hydrograph of the well and the decline in water level during most of an extended drought. However, because the model required discontinuous movement of the interface between freshwater and salt water, some error was introduced into the solutions. The DIR model was used to predict the response of water levels to modifications in recharge patterns on the South Fork of Long Island. (Lee-ISWS)

E. S. Sprunt, and A. Nur.
Geology, Vol. 4, No. 8, p 463-466, August 1976. 5 fig, 10 ref. NASA NSG-7117.

Descriptors: *Porosity, *Pressure, *Sandstones, Pores, Stress, Laboratory tests, Hydrostatic pressure, Particle size, Rocks, Groundwater, Geology.
Identifiers: *Pressure solution.

Under nonhydrostatic stress, the porosity of water-saturated St. Peter sandstone was reduced by more than 50% through pressure solution. The rate of porosity reduction was dependent on the pore fluid pressure. Hydrostatic pressure alone resulted in no porosity reduction, which indicates that shear stress is necessary for the reduction of porosity by pressure solution. (Sims-ISWS)

Descriptors: *Saturated soils, *Resistivity, *Seismic properties, Aquifers, *Exploration, Water resources, Water quality, Geophysics, *Sands.

A critical appraisal is made of the relative usefulness of the electrical resistivity and seismic refraction methods in detailed exploration of arenaceous aquifers. It is demonstrated that both techniques are useful in the mapping of aquifer boundaries although the field procedure for the refraction method is more complex. Seismic refraction is more useful in locating the water-table, but the mapping of water quality necessarily uses electrical resistivity. The accuracy of measurement of formation resistivity factor and compressional wave velocity is considered with regard to the prediction of effective porosity and intergranular permeability. It is concluded that the formation resistivity factor is a significantly better indicator of both these hydrological parameters. Thus the resistivity method should be the prime tool in the geophysical exploration of arenaceous aquifers with seismic refraction having a supporting but nevertheless important role. (South Africa)

2G. Water In Soils

PERCOLATION OF SURFACE-APPLI WATER IN THE FIELD,
Kentucky Agricultural Experimental Station, L ington.
V. L. Quisenberry, and R. E. Phillips.
Soil Science Society of America Journal, Vol No 4, p 484-489, July-August 1976. 10 fig, 10 ref

Descriptors: *Percolation, *Soil water moveme *Soils, *Irrigation, Chlorides, Tracers, Unsa rated flow, Groundwater movement, Infiltrati Percolating water, Porosity, Soil moisture, S water, Topsoil, Loam, Clay loam, Rainf Agriculture.

Percolation of surface-applied water tagged w chloride was studied in Maury silt loam Huntington silty clay loam under field conditio Soil samples were taken in small increments to 90-cm depth several times following application water. Analyses of chloride content with depth dicated the position of the applied water relative the initial soil water in the profile. Three perco tion studies were conducted on Maury silt lo soil. In the first study, an application of 4.2-cm water increased the water content to the 60- depth within 1 hour following irrigation ev though the volumetric water profile averaged below the upper limit of the water holding capac through this depth. A second study conducted a slightly higher initial water content showed t 20% of a 4.2-cm application had penetrated bel the 90-cm depth immediately after application a 40% penetrated below this depth within 1 ho Similar results were measured in Huntington si clay loam. Simulated rainfall increased the wa content significantly to approximately the 15- depth in each of three studies. A large percentag of the water passing this depth apparently perc lated past the 90-cm depth with very little adso tion of water and chloride between these depth Location of chloride in the profile and movem of chloride past the 90-cm depth indicated tha large percentage of the applied water percolat past the water initially present with little displa ment of the initial water. ntifiers: *Root cortex, Specific moisture pacity, Endodermis, Darcy-Richards equation, chappa sandy loam.

uations were developed which describe the nsient flow of water in a cylindrical soil-root tem. The main objective was to calculate water tential distributions in the root cortex as well as the surrounding soil. Numerical results in-ated that there will be small water potential dients in the soil relative to those in the root in upper 90% of the water availability range. Con-ry to past experiments, theory predicted that preciable amounts of water should flow from ots to soil when roots well supplied with water in contact with dry soil. An important implica-n of the study was that models designed to pre-t the pattern in which roots extract water from l will have to consider the rate-limiting aspect of root tissue. (Visocky-ISWS)

STEADY FLOW OF WATER THROUGH ILS DRAINED BY PARALLEL DITCHES, (IN ENCH),
essaloniki Univ., Salonika (Greece). Faculty of ronomy.
Tzimopoulos, and G. Terzidis.
J Hydrol (AMST) 27(1/2), p 73-93, 1975.

Descriptors: *Soils, *Unsteady flow, *Soil water movement, *Drainage, Equations model studies, Ditches, Europe.
Identifiers: *Boussinesq equation, *Greece.

The water movement through soils drained by parallel ditches is in general unsteady and can be described by the nonlinear Boussinesq equation. An analytical solution of this drainage equation subjected to general initial and boundary conditions has not yet been found because of its nonlinearity. Numberical methods should be used to obtain approximate solutions of the mixed boundary value problems of this equation. Numerical solutions are presented based on implicit computational schemes of the Crank-Nicolson, Laasonen and Douglas types. Experimental data, obtained by a Hele-Shaw model in the Hydraulics Laboratory of the School of Agriculture of the University of Thessaloniki (Greece), are in very good agreement with the values computed numerically by these implicit schemes.--Copyright 1976, Biological Abstracts, Inc.

Identifiers: Neutron thermalization, Prosopisis juliflora, Velvet mesquite.

A study was conducted to determine the amount of soil moisture used by the mature velvet mesquite trees on an upland site in southern Arizona. In addition, the moisture used by the trees at various distances from their trunks was quantified. Using the neutron thermalization method, soil moisture measurements were made adjacent to four live and four dead trees. Soil moisture levels at selected distances from the live and dead trees were compared and the differences graphically evaluated to determine seasonal soil moisture use. The results are presented. Despite problems encountered, the method offers a means of determining the quantity of moisture use by plants without significantly altering their immediate environment. (Jamail-Arizona)

Identifiers: *Soil suction.

The moisture dynamics of an undisturbed soil monolith were studied during a lysimeter experiment. Daily measurements were made of the soil suction at 10 depths. Also measured daily were the precipitation, the seepage, and the evaporation from the monolith during a 3-year period. For selected periods, a drying (desorption) curve and a wetting (sorption) curve of the soil moisture characteristic were determined from field data. Also, the capillary conductivity was determined with use of daily monolith observations. By using these hydraulic functions, the unsaturated soil moisture flow equation was solved numerically for one-dimensional vertical flow. In order to determine the effect of hysteresis on the suction distribution in the monolith, calculations were performed either with the desorption curve or with the sorption curve without scanning between the curves. Neither of the two curves led to complete agreement between observed and calculated soil suction values; the desorption curve usually gave too high values, and the sorption curve gave too low values. RADIATION HAZARD FROM AMERICIUM-BERYLLIUM NEUTRON MOISTURE PROBES,
North Dakota State Univ., Fargo. Dept. of Soils.
G. W. Gee, J. F. Stiver, and H. R. Borchert.
Soil Science Society of America Journal, Vol. 40, No. 4, p 492-494, July-August 1976. 3 fig, 1 tab, 4 ref.

Descriptors: *Soil moisture meters, *Nuclear moisture meters, *Hazards, *Radiation, Soil moisture, Radioactivity, Safety, Instrumentation, Equipment, Monitoring, Measurement, Soil science.
Identifiers: *Radiation hazards, Fast neutrons, Radiation doses.

Neutron fluxes from shielded neutron moisture probes need to be measured to evaluate total radiation exposure from these instruments. Theoretical considerations suggest that for 100 mCi Am-Be neutron moisture probes the fast neutron flux can be relatively high and contribute significantly to the radiation exposure of probe operators. Measured radiation dose levels at the surface of 100 mCi Am-Be neutron probes manufactured by Troxler Laboratories were found to be as high as 37 m Rem/hour which exceeds reported levels by as much as 38 times. This was believed to be due to nonreporting of fast neutron fluxes. It was mentioned that conventional field use of these probes may present a radiation hazard to operators if the probe is hand carried for periods which exceed three hours per week. It was recommended that the probe be transported to and from sites inside a wooden storage crate and be kept at least 1 m from

personnel. Also, to improve the radiation safety factor for on site use, it was recommended that a hand cart be used to transport the probe. (Sims-ISWS)

Identifiers: Soil-water characteristics.

A ring infiltrometer with varying width of buffer zone in combination with multiple-depth tensiometers was tested for determining the hydrologic properties of a Typic Dystrandept (Tantalus silty clay loam) soil profile on a forested watershed in Hawaii. With location of one multiple-depth tensiometer at the vertical axis of the axisymmetric flow system and one or more at a given radius outside the inner ring, the vertical and the radial hydraulic gradients could be simultaneously measured. It was thus possible to estimate the lateral flow components and to determine vertical infiltration rates and hydraulic conductivites (at field saturation) of the different soil horizons. Lateral flow decreased with time during infiltration. Under the moist-to-wet conditions of the soil under study, lateral flow was not appreciable. From an inner ring of 30-cm diameter, the lateral flow was practically eliminated when a buffer ring of 90-cm diameter was employed. The effect of lateral flow on the final infiltration rate was negligible even when a buffer ring of 60-cm diameter was used. (Sims-ISWS)
W77-01325

VISCOSITY OF INTERLAYER WATER IN MONTMORILLONITE,
Purdue Univ., Lafayette, Ind. Dept. of Agronomy.
P. F. Low.
Soil Science Society of America Journal, Vol. 40, No. 4, p 500-505, July-August 1976. 4 fig, 1 tab, 30 ref.

Descriptors: *Viscosity, *Permeability, *Clays, *Montmorillonite, *Viscous flow, Flow resistance, Diffusion, Hydraulic conductivity, Porous media, Soils, Soil properties, Physical properties, Analytical techniques, Groundwater movement, Soil water movement, Soil science.

The viscosities of water in Na-montmorillonite system at various water contents were calculated by different equations using data from experiments conducted by different investigators on: (1) viscous flow of water at different temperatures, (2) self-diffusion of water, and (3) neutron scattering by water. The results were remarkably consistent and showed that the viscosity of the interlayer water is greater than that of bulk water and increases exponentially with decreasing water content. Evidence was also presented to show that the viscosity of this water depends on the b-dimension of the associated montmorillonite. By combining the data on viscosity with data on hydraulic conductivity, it was possible to determine the permeability of the montmorillonite at different water contents. (Sims-ISWS)

HEAT AND WATER MOVEMENT UNDER SURFACE ROCKS IN A FIELD SOIL: I. THERMAL EFFECTS,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
W. A. Jury, and B. Bellantuoni.
Soil Science Society of America Journal, Vol. 40, No. 4, p 505-509, July-August 1976. 6 fig, 2 tab, 13 ref.

Descriptors: *Soils, *Rocks, *Heat flow, *Soil moisture, Soil water movement, On-site investigations, Model studies, Mathematical models, Thermal conductivity, Water vapor, Mulching, Droughts, Arid lands, Groundwater movement, Soil science.
Identifiers: Water vapor movement, Thermal effects.

Results of a field experiment designed to evaluate the effect of surface rocks on soil heat flow were presented. Temperature observations were made by thermocouples at 12 locations under and adjacent to rocks placed over bare soil. Continuous readings were taken for 24- and 48-hour intervals using seven different kinds of rock cover, ranging from large granite slabs to gravel piles, during the time between December 1974 and August 1975. Experimental results consistently showed a non-negligible 24-hour net horizontal heat flow toward the rock at both the 2.5 and 5.0 cm depth. Net vertical heat flow was always downward in the soil under the bare surface but was observed to be either upward or downward in the soil under the rock cover depending on prior conditions. Because water vapor movement in moist soil is generally in the same direction as heat flow, it was suggested that surface rock cover may be a mechanism for water collection in arid climates. A simulation model was constructed to describe two-dimensional heat flow in a uniform soil with a rectangular rock on the surface. Using the measured surface temperature as boundary values and a soil thermal conductivity corresponding to the mean daily soil surface temperature, the simulation model adequately reproduced the observed temperatures under and adjacent to the rock. (See also W77-01328) (Sims-ISWS)

Identifiers: Water vapor movement, Moisture effects.

Results were presented from a field experiment conducted to determine the effect of surface rocks on soil water content change under bare soil. First, stones were placed at intervals over an initially dry field (gravimetric water content = 0.021 g/g) and left for 6 weeks. Subsequent sampling showed a small, but detectable, excess of water stored under the rock compared to adjacent bare soil. Following an irrigation, buried thermal conductivity probes were used to monitor water content changes under and adjacent to surface rocks. After 24 days, the soil under the rock contained significantly more water than did the soil region adjacent to the rock, a finding confirmed by gravimetric sampling. Following this, the stones and probes were relocated for a further 24 days of observation, with similar results obtained. In a separate laboratory experiment using a large, sealed soil column with a rock covering part of the surface, it was demonstr that a significant amount of water moved to cylinder of soil under the rock from the soil re under the bare surface due to horizontal temp ture gradients induced by the rock covering pa the surface. A two-dimensional computer prog calculating water vapor movement under the gradients was used with measured field temp ture boundary conditions to estimate the am of water vapor movement expected to occur to a rock cover on the soil surface. Results qua tively confirmed the observations of the se laboratory column experiment. (See also W 01327) (Sims-ISWS)

FUTURE CHEMICAL COMPOSITION OF THE GREAT SALT LAKE BRINES,
Brigham Young Univ., Provo, Utah.
J. M. Glassett, and P. J. Smith.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-260 505, Price codes: A09 in paper copy, A01 in microfiche. Completion Report, August 1976. 168 p, 2 tab, 19 fig, 47 ref, 8 append. OWRT B-126-UTAH(1). 14-34-0001-6124.

Descriptors: *Brines, *Salinity, *Mathematical models, *Specific gravity, Saline lakes, Saltation, Diffusion, Mixing, Planning, Hydrology, *Great Salt Lake, *Utah, Bridges, Forecasting, Salt balance, Lakes, Water balance, Culverts, Chemistry.
Identifiers: Railroad causeway, Culvert flows, Causeway flows.

A fifteen mile long rock and gravel railroad causeway was completed across Great Salt Lake in 1959 dividing the lake into north and south arms. This causeway has resulted in drastic hydrological changes within the lake. Past predictions of the future salinity of the Great Salt Lake brines have been largely empirical extrapolations. This study developed a theoretical mathematical model to more accurately predict the specific gravity of the upper south arm brine for any year or lake elevation. The basic parameters which were modeled include: (1) the overall salt and water balances, (2) the diffusion and mixing of salts from the dense lower layer of the south arm of the lake into the more dilute upper layer, (3) the two directional flows of brine through the culverts which breach the causeway, and (4) the two directional flows through the permeable causeway fill. Results show that the specific gravity of the upper south arm brine is reaching a steady state situation in which its salinity will remain constant with time.

A CLIMATONOMIC STUDY OF THE LAKE ONTARIO DRAINAGE BASIN,
California Univ., Berkeley, Dept. of Geography.
O. Granger.
Water Resources Research, Vol. 12, No. 4, p 751-761, August 1976. 6 fig, 6 tab, 30 ref.

Descriptors: *Runoff, Lake Ontario, *Streamflow, *Model studies, *Evapotranspiration, Drainage area, Seasonal, Equations, Moisture, Energy, Evaporation, Watersheds(Basins), *Climatology.
Identifiers: *Lake Ontario basin, *Climatonomic study, Monthly runoff, Moisture level, Stored moisture change, Moisture regimes.

An evapotranspiration climatology model was applied to the Lake Ontario drainage basin and to subbasins within it. The model was based on the model of Lettau and Baradas (1973) and was designed to compute monthly runoff, actual evapotranspiration, exchangeable moisture level and stored moisture change, and incorporated seasonally varying parameter values. The model was refined and improved by using a 'direct search' optimization technique (Rosenbrock, 1960) to obtain monthly values of the set of prescribed parameters, which were calibrated using data for 1969-1971 inclusive and for long-term means. The parameters were then applied to relevant 1972 data as an independent test of the validity of the model. The results were consistent and reasonably reliable by comparison with others. The parameter values were physically justifiable and in accord with comparable parameter values reported in the literature. Computed monthly runoffs were within 1.4% of observed streamflow in the unregulated subbasins and within 6.0% in a subbasin that was regulated. For the Lake Ontario basin as a whole, computed monthly runoff was within 7.0% of measured outflow adjusted for lake level changes. The agreement was within 3.5% in the case of annual values. Computed monthly actual evapotranspiration was in excellent agreement with other studies. It was concluded that the model, with a calibrated set of seasonally varying parameter values, was a viable approach for the study of the moisture regimes of catchments. (Roberts-ISWS)

PRELIMINARY ESTIMATION OF COLD WATER AVAILABILITY IN LAKES FOR FISH HATCHERIES,
MacLaren (James F.) Ltd., Willowdale (Ontario). Hydrotechnical Div.
G. Balachandran, P. E. Wisner, and H. S. Belore.
Water Resources Bulletin, Vol. 12, No. 5, p 1041-1048, October 1976. 2 fig, 11 ref.

Descriptors: *Fish hatcheries, *Lakes, *Stratification, *Temperature, *Cold-water fish, *Water availability, *Estimating, Management, Water quality, Freshwater, Simulation analysis, Equations, Mathematical models, Systems analysis, Forecasting.
Identifiers: *Thermal models, Water withdrawal rate.

Fish hatcheries for cold water species (e.g., salmonids) require water below a certain specified optimum temperature. Deep lakes and reservoirs, which are thermally stratified, will have cold water below the thermocline suitable for fish hatchery supplies. Proper management will require withdrawal of water at different depths and a mixture of correct proportions can yield water at desired temperatures and quality. For preliminary studies, a mathematical model can be used to show by a comparatively simple computation the effect of different withdrawal rates of cold water and to check if the situation is critical. A critical situation may warrant the application of sophisticated computer models and/or the use of chilling at the hatchery. The method is illustrated by a case study for a small lake in the Province of Nova Scotia. (Bell-Cornell)

IFYGL RAWINSONDE DATA ACQUISITION SYSTEM,
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
C. J. Callahan, J. A. W. McCulloch, E. J. Aubert, and E. M. Rasmusson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 968, Price codes: A03 in paper copy, A01 in microfiche.
IFYGL Technical Manual Series No. 6, January 1976. 42 p, 13 fig, 14 tab, 13 ref.

Descriptors: *Remote sensing, *Meteorological data, *Great Lakes, *Atmosphere, Winds, Pressure, Atmospheric pressure, Temperature, Air temperature, Humidity, Sites, Operation and maintenance, Equipment, Data processing, Weather data, Meteorology, International Hydrological Decade.
Identifiers: *International Field Year for the Great Lakes, *Rawinsondes.

Early in the planning stages of IFYGL, in 1967, substantial interest developed in the general topic of lake meteorology and evaporation. The Boundary Layer, the Terrestrial Water Balance, and the Energy Balance Panels were involved in calculations whose accuracy could be improved by a denser network of upper air stations than was normally operated by the United States and Canadian governments. A study of previous network augmentations and the results of three feasibility studies conducted by the Canadian Atmospheric Environment Service were integrated. This evaluation indicated a reasonable probability of obtaining useful weekly-to-monthly estimates of lake evaporation with a network of six to eight LORAN-C rawinsonde stations around the lake, and a high probability of obtaining a unique set of high-quality, high-resolution data from these same stations for use in other studies. The decision was made, therefore, to conduct an IFYGL rawinsonde program. This report on the IFYGL Rawinsonde Data Acquisition System had two major objectives: (1) to provide data users with descriptions of the equipment, techniques, and procedures used in collecting the data, and of data characteristics, and (2) to provide investigators planning similar programs in the future with operational details on capability, performance, and cost factors as an aid in planning, logistics, and decision making. Trans. roy. Soc. S. Afr., Vol. 41, Part 3, p 225-240, (1975). 9 fig, 18 ref.

Descriptors: *Lake morphometry, Bathymetry, *Lake stages, *Africa, *Lakes.
Identifiers: South Africa, Natal, Zululand, Mocambique, *Coastal lakes(Africa).

There are two groups of southern African lakes, a southern group made up of the Wilderness lakes and a north-eastern group comprising lake on the Natal, Zululand and southern Mocambique coastal plain. Bathymetric maps are presented for representative lakes of these two series. There appear to be three types of lakes with respect to origin. Most of the lakes represent drowned valleys associated with river systems. Evidence is presented to show that St Lucia, although 1 to 2 m deep at present, was originally much deeper. The narrow coastal lakes of southern Mocambique are interpreted as low-lying land inundated as a result of rise in sea-level. The third type of lake is typified by Rondevlei at Wilderness, this lake apparently originated as a deflation basin. (South Africa)

SURVEY OF MGOBEZELENI LAKE-SYSTEM IN ZULULAND, WITH A NOTE ON THE EFFECT OF A BRIDGE ON THE MANGROVE SWAMP,
Institute for Freshwater Studies, Ubombo (South Africa). Lake Sibaya Research Station.
M. N. Bruton, and C. C. Appleton.
Trans. Roy. Soc. S. Afr., Vol 41 (3), p 283-294, (1975). 4 fig, 2 tab. 17 ref.

Descriptors: *Lakes, Mollusks, Crustaceans, Fish populations, Bridges, Mangrove swamps, *Biota, Water level, Salinity, Limnology, Environmental impact, Africa.
Identifiers: South Africa, *Mgobezeleni lake, *Zululand, Natal, Decapoda.

The Mgobezeleni lake-system in Zululand is described and a checklist of decapod crustacea, molluscs and fish presented. The biota consists of freshwater, estuarine and marine forms. Several uncommon or rare species were found. The eff of various man-made changes on the system is sessed, with particular reference to the mangro community. Constantly high water levels and cess fresh water have decimated the Bruguie gymnorhiza forest and associated fauna resp tively. (South Africa)

THE LIMNOLOGY OF LAGOA POELELA,
Rhodes Univ., Grahamstown (South Africa). In of Freshwater Studies: and Rhodes Uni Grahamstown (South Africa). Dept. of Zoolo and Entomology.
B. J. Hill, S. J. M. Blaber, and R. E. Boltt.
Trans. Roy. Soc. S. Afr., Vol 41 (3), p 263-2 (1975). 2 fig, 3 tab, 15 ref.

Descriptors: *Limnology, Salinity, Water te perature, Dissolved oxygen, Light penetrati Lakes, Aquatic weeds, Sodium, Fish populatio Brackish water, Physicochemical properti Africa, Tilapia.
Identifiers: *Lagoa Poelela, *Mozambiq Southern Africa, Potamogeton pectinatus, Nai Chara.

The limnology of Lagoa Poelela in southe Mozambique was investigated in July 1973. T lake is connected to the sea via a 75 km long ch nel, the area is 65 km2, it has a mean depth 13,7m and a maximum depth of 24 m. The wa was saline (8 degree/00) and the major ions, w the exception of sodium, were in the proportio expected of diluted sea water. The concentrati of sodium was twice as high as expected; this so um enrichment has been found in other coas lakes. Temperatures were relatively uniform fr the surface to the bottom and the oxygen satu tion at 20 m was 80% of the surface value. Li penetration was higher than for other southe African lakes and at 22 m was 3% of surface il mination. Aquatic macrophytes were absent fr shallow water in the main lake, only being fou deeper than 3 metres where Potamogeton p tinatus and Naias marina were common. Na was found to a depth of 10 m and Chara sp. to m. Only 11 species of fish were found. The fi population was dominated by the cichlids Tila rendalli and T. mossambica although so estuarine species were also found. It is suggest that the domination of this brackish lake cichlids reflects a general tendency for cichlids increase in numbers in estuarine systems wh become isolated from the sea. (South Africa)

emical analysis, Biological properties, ytoplankton, Zooplankton, Benthos, Water nperature, Thermal stratification.

ysical, chemial, and biological data collected ring the 1975 calendar year are presented for 43 ine lakes. Methods for the collection and analy- of the hydrologic data are outlined. Physical aracteristics include drainage area, surface area, face elevation, volume, maximum depth, mean pth, epilimnion depth, epilimnion volume, and gth of shoreline. Water-quality analyses are ed for up to 27 parameters on the lake-sample es and 5 parameters on flowing tributaries. ological analyses include phytoplankton data for lakes, zooplankton data for 4 lakes, benthic croinvertebrate data for 25 lakes, and bacterial ta for lake tributaries. ntifiers: *Lake Nhlange, *South Africa, Ox- en depletion.

ke Nhlange (KwaZulu, South Africa) is con- cted to the sea through the Kosi estuary and has alinity between 36 degrees/oo and 5 degrees/oo. e benthos of the lake was sampled at approxi- tely six-monthly intervals from July 1965 to January 1969. The substrates are mainly sandy in shallow water and also on steeply sloping profiles even in the deepest water of 30 m. Flat areas are mainly silty. In December 1965, following the closure of the estuary mouth and severe rains, the lake level rose to about 2 m above its normal level. Although the salinity changed little (5 degrees/oo to 3 degrees/oo), quantities of peat-stained water and detritus were brought into the lake. A waning pattern of low oxygen conditions below about 12 m in the hot season, followed by reasonably well-oxygenated conditions in the cold season, was found. Particularly severe oxygen depletions were discovered at the mud water interface, even where well-oxygenated conditions pertained in the open water column at equivalent depths. Evidence that the fauna was driven into shallower waters by the influx of detritus, with its high oxygen demand, is given and a slow recolonization of the deeper water is shown. THE BENTHOS OF SOME SOUTHERN AFRICAN LAKES PART 4: THE BENTHOS OF LAGOA POELELA,
Rhodes Univ., Grahamstown (South Africa). Dept. of Zoology and Entomology; and Rhodes Univ., Grahamstown (South Africa). Inst. of Freshwater Studies.
R. E. Boltt.
Trans. Roy. Soc. S. Afr., Vol 41(3), p 273-281, (1975). 4 tab, 8 ref.

Descriptors: *Benthos, *Vertical distribution, *Benthic fauna, Dominant organisms, Zooplankton, Lakes, Standing stock, Biomass, Submerged plants, Species abundance, Africa.
Identifiers: Pontogeloides latipes, *South Africa, *Mozambique, *Lagoa Poelela, Musculus virgilius, Chara, Grandidierella bonnieri.

The benthos of Lagoa Poelela (Mozambique) was sampled in July 1973 with a Van Veen grab. The substrates of the lake were sandy between 0 m and about 3 m. Thereafter sand and silt were common to about 9 m and mainly pure silt below this depth. The benthos was mainly distributed between 0 and about 12 m, with very little below that depth. The faunal list comprises 19 taxa of which only nine can be classed as truly dominant benthic organisms, the remainder being only either planktonic forms with brief sojourns in the benthos or uncommon. Three forms dominate the standing stock biomass. Musculus virgilius associated with Chara between 5 and 2 m has a biomass of 2,307 g m-2. Grandidierella bonnieri has a biomass of 0,213 g m-2 between 0 and 3 m and 0,143 between 5 and 12 m. Pontogeloides latipes is most abundant in 0-3 m with a standing stock of 0.172 g m-2. It is argued that this lake may develop either a thermocline or a halocline or both during summer, and hence the very low biomass of 0,007 g m-2, below 12 m. (See also W77-01437 and W77-01439) (South Africa)

THE BENTHOS OF SOME SOUTHERN AFRICAN LAKES PART 5: THE RECOVERY OF THE BENTHIC FAUNA OF ST LUCIA LAKE FOLLOWING A PERIOD OF EXCESSIVELY HIGH SALINITY,
Rhodes Univ., Grahamstown (South Africa). Dept. of Zoology and Entomology; and Rhodes Univ., Grahamstown (South Africa). Inst. of Freshwater Studies.
R. E. Boltt.
Trans. Roy. Soc. S. Afr., Vol 41 (3), p 295-323, (1975). 6 fig, 11 tab, 11 ref, append.

Descriptors: *Benthos, *Benthic fauna, *Salinity, Aquatic insects, *Salt tolerance, Ostracoda, Zooplankton, Gravimetric analysis, Numerical analysis, Standing stock, Dominant organisms, Food abundance, Diptera, Africa.
Identifiers: *St Lucia Lake, *Zululand, Natal, *South Africa, Assiminea bifasciata, Polypedilum.

St. Lucia Lakes (Zululand, South Africa) were sampled with a Van Veen grab in January 1972, July 1972, and January 1973. The system had high salinities at the commencement of the programme (70 degrees/oo-80 degrees/oo False Bay, 55 degrees/oo-60 degrees/oo North Lake, 45 degrees/oo-58 degrees/oo South Lake) which quickly dropped to less than sea-water values in the first six months. The January 1972 samples showed that only a few Polypedilum (Chironomidae) survived in False Bay, while a very reduced faunal list was shown for North Lake (9 sp.). Nevertheless South Lake showed a fairly complete faunal list (21 sp.). By July 1972 nine species were recovered in False Bay, 18 in North Lake and 23 in South Lake, indicating reinvasion consequent upon dilution of the salts in the water. No great change was shown by the result of the January 1973 samples. Evidence suggests that most forms would tolerate salinities up to about 55 degrees/oo salinity. Beyond this level only Chironomid larvae and Ostracods survived. Most rapid reinvasion of the denuded parts of the system was by rapidly maturing forms with planktonic larvae. There is evidence of exchanges of water between the various areas consequent upon wind induced seiches which would carry the planktonic larvae to these denuded areas. I. Matonickin, Z. Pavletic, V. Tavcar, and N. Krkac.
Prirodosl Istraz Acta Biol. 40, p 5-68, 1971.

Descriptors: *Inflow, *Karst, *Karst hydrology, *Water types, Biological communities, Running waters, Alkalinity, Hardness(Water), *Travertine, Limestones, *Mosses, Lakes.
Identifiers: Cinclidotus aquaticus, Cratoneurum commutatum, Didymodon tophaceus, Platyhpnidium rusciforme, *Reicotops, *Yugoslavia(Plitvice Lakes).

Exceptional hydrological conditions such as a large influx of water and karstic terrain have produced unique ecological conditions in the running water biotopes of this area. The waters have high alkalinity and bicarbonate hardness. The complex of living communities in the Plitvice Lakes is very distinct and depends on ecological factors and the degree of development of travertine forms. These communities are briefly described and their flora and fauna discussed. Mosses such as Cinclidotus aquaticus, Platyhypnidium rusciforme, Cratoneurum commutatum and Didymodon tophaceus may, depending on the temperature, actively build travertine layers.—Copyright 1975, Biological Abstracts, Inc.

BIOLOGY OF JUVENILE BREAM IN THE MINGECHAUR RESERVOIR, (IN RUSSIAN),
L. V. Strazhnikova.

Izv Akad Nauk Az SSR Ser Biol Nauk. 4, p 89-91, 1974.

Descriptors: Rivers, Reservoirs, *Fish, *Growth rates, *Juveniles, *Fish biology.
Identifiers: Azerbaijan-SSR, *Bream, *Mingechaur, Reservoir(USSR).

The growth rate of juvenile bream in the Mingechaur Reservoir on the Kura River in the Azerbaijan SSR (USSR) has accelerated slightly in the 1st years since the reservoir opened in 1953. In comparison with other bodies of water the growth rate of juveniles is slightly lower and there is a lag in the ponderal index. The ponderal index of the juveniles changes little during the year, apparently because of abundant food.--Copyright 1975, Biological Abstracts, Inc.

WATER SUPPLY CATCHMENT HYDROLOGY RESEARCH: THE WALLABY CREEK FOG DRIP STUDY,
Melbourne and Metropolitan Board of Works (Australia). Hydrological studies Section.
M. J. O'Connell, and P. J. O'Shaughnessy.
Melbourne and Metropolitan Board of Works Reports No. MMBW-W-004, May 1975. 38 p. 8 fig., 8 tables, 7 ref., 3 append.

Descriptors: *Fog, *Forest watersheds, *Interception, *Australia, Vegetation effects, Water yield, Age, Forests, Water supply, Precipitation(Atmospheric).
Identifiers: *Eucalyptus-regnans, *Wallaby Creek(Vic), *Fog drip.

A study is reported which aimed to measure fog drip and assess its importance as a source of precipitation under mountain ash forest (Eucalyptus regnans), and to determine the effect of forest age on the magnitude of fog drip. Two plots, each 40 metre square were set up under different aged stands of mountain ash, and equipped with recording rain gauges, which were relocated at random every week. A further recording rain gauge was placed at a fixed location in a clearing. Fog drip was determined by comparing the precipitation records under the forest with that in the open. Over a four-year period, it was concluded that fog drip under the forest was less than one percent of gross precipitation in the open, and that there was no significant effect of forest age on fog drip. LEAF WATER POTENTIAL AND STOMATAL ACTIVITY IN SORGHUM AS INFLUENCED BY SOIL MOISTURE STRESS,
Nebraska Univ., Lincoln. Dept. of Horticulture and Forestry.
A. Blum, and C. Y. Sullivan.
Israel Journal of Botany, Vol 23, p 14-19, 1974. 4 fig, 15 ref.

Descriptors: *Sorghum, *Moisture stress, *Soil-water-plant relationships, *Soil moisture, *Leaves, Stomata, Crops, Drying, Transpiration, Droughts, Cereal crops, Wetting, Growth chambers, Diffusion.

Five sorghum varieties were grown in soil in a growth chamber and submitted to two consecutive soil drying cycles separated by a three day recovery period. During each drying cycle measurements were made on stomatal pore width, leaf diffusion resistance, leaf water potential and soil water potential. The water relations of sorghum plants differed greatly between the two drying cycles. A major effect of the first drying cycle on plant response to stress during the second drying cycle was a markedly reduced response of stomotal aperture to change in leaf water stress, thus confirming previous research findings. A second effect concerned relations between soil water potential and leaf water potential. As soil water potential decreased, plants in the second cycle maintained a higher (less negative) leaf water potential than in the first drying cycle. A previous drought may reduce the soil-to-leaf water potential gradient developed along the recovered plant, and thus imply increased adaptation to soil moisture stress, or a hardening effect. THE EFFECT OF ENVIRONMENTAL FACTORS ON THE GROWTH OF A NATURAL PASTURE,
Hebrew Univ., Jerusalem (Israel). Dept. of Botany.
D. Wallach.
Agricultural Meteorology, Vol. 15, p 231-244, 1975. 6 fig, 2 tab, 16 ref.

Descriptors: *Mathematical models, *Growth rates, *Environmental effects, *Soil moisture, Semiarid climates, Biomass, Least squares method, Temperature, Pastures, Evapotranspiration, Soil horizons, Moisture content.
Identifiers: *Negev region(Israel).

Using a semi-empirical approach, growth curve
are analyzed for three years for a natural pastur
at the Migda Experimental farm in the Negev re
gion of Israel. To study the dependence of th
growth curves on environmental factors, logisti
equations in which the growth rate R is a functio
of soil moisture or temperature have been use
The parameters that appear are optimized by
non-linear least-squares technique. Soil moistur
is an important variable. Temperature alone is c
no predictive value, but temperature in conjunc
tion with soil moisture is of marginal importanc
The results are quite insensitive to the differe
measures of soil moisture and temperature co
sidered. The fit to the data when R is a function o
both soil moisture and temperature is still not full
satisfactory. It seems that semi-empirical equa
tions can profitably be used to investigate specifi
aspects of crop growth, those dealing with en
vironment interactions. It remains to be see
whether it is possible to find simple equatio
which would be fully adequate as predictive tool

BIOLOGY OF THE SNAKEHEAD IN THE SY DARYA BASIN, (IN RUSSIAN),
G. M. Dukravets, and A. I. Machulin.
Izv Akad Nauk Kaz SSR Ser Biol. 6, p 40-42, 197

Descriptors: Fish, *Fish populations, River Biology.
Identifiers: Ophiocephalus-argus-warpachowski *Snakehead, *Syr-darya River, *USSR, Uzbek SSR.

The Amur snakehead Ophiocephalus argus wa
pachowskii entered a basin of the Syr Darya Rive
in the early 1960's while herbivorous fishes wer
being hauled to pond fisheries of the Uzbek SS
(USSR). By 1964 it had spread to the lowe
reaches of the river and at present has firml
colonized the entire basin of the Syr Darya an
estuarine parts of the Aral Sea. Data are presente
on the size, age, growth, fecundity, reproductio
and feeding of the snakehead in lakes of the lowe
reaches of the Syr Darya. Its growth has slowe
slightly, fecundity has increased, the diet has e
panded and the character of sexual maturation
undergoing changes toward single spawning.

dlings were subjected to the effect of varying
rees of soil moisture (100, 85, 70, 55, 40 and
of the maximum water-holding capacity). The
sture degree in the separate treatments was
ntained in the 1st yr after planting, while dur-
the next 4 yr conditions were similar and soil
sture in all treatments was about 85% of the
imum waterholding capacity. The drought in
1st yr after planting had affected the growth of
greater part of the young seedlings. After the
er regimen of the soil was improved, the dif-
ntiation of the seedlings became more marked,
ecially those that were grown at 40 and 25% of
soil moisture in the 1st yr. The ratio was lowest
ween the weight of the root system and the
ght of seedlings (2.3), grown at 100% of the
imum waterholding capacity of the soil, and
highest (4.9) in those that were grown at a
sture of 55% of the maximum waterholding
acity of the soil.--Copyright 1975, Biological

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 102, No HY7, Proceedings Paper No 12269, p 1035-1049, July 1976. 9 fig, 8 ref, 2 append. NSF ENG74-03037.

Descriptors: *Bed load, *Sediment transport, *Correlation analysis, *Statistical methods, *Tracers, Dispersion, Probability, Laboratory tests, Analysis, Sediment discharge, River beds, Radioisotopes, Equations, Radioactivity.
Identifiers: Distribution functions.

The stochastic characteristics of the discrete movements of a sand grain moving as bed load under the action of flowing water were examined. Functional relationships between the step length (or rest duration) distributions and the probability of a sand grain making a specified number of steps (or rest durations) over a distance (or time) were derived and compared with the results from radioactive tracer experiments. A technique for determining the behavior of the density functions for step lengths and rest durations was developed. This technique involved determination of the curvature of the autocorrelation function which was constructed from the step length and rest duration data. (Adams-ISWS)

Rosenstiel School of Marine and Atmospheric Sciences, Miami, Fla.
G. K. Ward, and F. J. Millero.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A021 557, Price codes: A02 in paper copy, A01 in microfiche. Geochimica et Cosmochimica Acta, Vol 39, p 1595-1604, 1975. 3 fig, 7 tab, 49 ref.

Descriptors: *Ionization, *Chemical properties, *Pressure, *Sodium chloride, *Sea water, Chemical reactions, Ions, Chemistry, Electrolytes, Boron, Water properties, Inorganic compounds, Physical properties, Water pressure.
Identifiers: *Boric acid, Sodium borate, *Ionizations constants, Chemical equilibrium, *Ionization equilibria, Pressure effects, NaCl, B(OH)3, NaB(OH)4, Nonelectrolytes, Molal volume, Partial molal volume, Boric acid ionization, Temperature effects.

The apparent molal volume of boric acid, B(OH)3, and sodium borate, NaB(OH)4, has been determined in 35,000 mg/l salinity seawater and 0.725 molal NaCl solutions at 0 and 25 C from precise density measurements. Similar to the behavior of nonelectrolytes and electrolytes in pure water, the molal volume of B(OH)3 is a linear function of added molarity. The molal volume of NaB(OH)4 is a linear function of the square root of added molarity in seawater and NaCl solutions. This paper presented results of studies of B(OH)3 in 0.725 molal NaCl solutions. The partial molal volumes of B(OH)3 and NaB(OH)4 in seawater and NaCl were determined from the apparent molal volume by extrapolating to infinite dilution in the medium. The partial molal volume of B(OH)3 was larger in seawater than pure water, apparently due to the ability of electrolytes to dehydrate the nonelectrolyte B(OH)3. The partial molal volume of NaB(OH)4 in itself, NaCl, and seawater was larger than the expected value at 0.725 molal ionic strength due to ion pair formation. The volume change for the ionization of B(OH)3 in NaCl and seawater was determined from the molal volume data. Values of partial molal volumes = -29.2 and -25.9 ml/mol were found in seawater, and partial molal volumes = -21.6 and -26.4 in NaCl, respectively, at 0 and 25 C. The effect of pressure on the ionization of B(OH)3 in NaCl and seawater at 0 and 25 C determined from the volume change was in excellent agreement with direct measurements in artificial seawater (Culberson and Pytkowicz, 1967) and natural seawater (Culberson and Pytkowicz, 1968). Descriptors: *Mathematical models, *Sea water, Theoretical analysis, *Model studies, *Ions, Mathematics, Analytical techniques, Chemical reactions, Electrolytes, Sulfates, Calcium sulfate, Carbonates, Fluorides, chlorides, Oceans, Calcium carbonate, Sodium sulfate.
Identifiers: *Ion-pairs, Ion-pair formation, *Ion-pair models, *Electrostatic, Borate, Sodium fluoride, Sodium carbonate, Sodium bicarbonate, Calcium fluoride.

Predictions of association constants for ion-pair formation in seawater were compared to measured constants as a test for the existence of ion-pairs. A fair agreement was obtained in most cases, although the theoretical electrostatic calculations indicate that significant chloride ion-pairing should occur which has not been observed in most experimental investigations. In: America's Renewable Resource Potential - 1975: The Turning Point, Proceedings, 1975 National Convention, Society of American Foresters, September 28-October 2, 1975, Washington, D. C., Society of American Foresters, Washington, D. C., p. 404-424. 4 fig, 5 tab, 30 ref.

Descriptors: *Nitrogen cycle, *Forest management, *Ecosystems, Productivity, Coniferous forests, Deciduous forests, *Southeast U.S., Nutrients, Recycling, *Cycling nutrients.
Identifiers: Relative stability.

A conceptual framework of elemental cycles was successfully applied to analyses of the nitrogen cycle in deciduous hardwoods and loblolly pine, which are two important southeastern forest ecosystem types. The relative stability of these ecosystems was defined in terms of resistance and resilence, and the impact of alternative levels of tree utilization on subsequent productivity after several rotations was evaluated. Results establish the relevance of ecosystem relative stability to practical mangement problems. (Forest Service)

ritish Columbia Univ., Vancouver, B. C. Inst. of nimal Resource Ecology.
B. Marliave.
ournal of the Fisheries Research Board of anada, Vol. 32, No. 10, October 1975, p 1687-691, 3 fig, 1 tab, 7 ref.

escriptors: Environmental effects, *Fish, Spawning, Temperature, Seasonal, Vaves(Water), On-site investigations, *Pacific cean, Intertidal areas.
lentifiers: *Black prickleback, Xiphister atropur-ureus.

pawning sites of the black prickleback, Xiphister tropurpureus, were studied. Shifts in spawning tes during the winter and spring spawning eriods were observed. This species selects under-oulder substrates of shells, pebbles, and small ocks that provide spaces most nearly matching ne cross-sectional body size of the adults for pawning sites. Spawning occurs under such a ide range of water temperatures from December May that slight temperature variations between tes could not solely account for differences. The easonal shift probably results because wave ac-on decreases as temperatures increase during the pring. (Chilton-ORNL)

lentifiers: Bothids, Pleuronectids, Cynoglossids, Flatfish.

a survey designed to locate spawning grounds nd trace dispersion of fish eggs and larvae on the ntinental shelf, 4 families, 17 genera, and 15 spe-es of fish were studied. The usual time of pawning was in the spring during seasonal tem-erature changes. Bothids have longer spawning easons than pleuronectids, beginning in spring nd continuing through early fall, in the southern alf of the study area. Pleuronectids spawned in e spring in the northern half of the survey area. ynoglossids spawned incidentally off North arolina but most of their larvae were transported to the study area from spawning grounds south Cape Lookout. There were only a few represen-tives of the family Soleidae and these originated outh of Cape Lookout. Onset of spawning was iggered by spring warming and fall cooling with ost species spawning within a relatively narrow nge of temperatures. (Chilton-ORNL)

WAVE PREDICTION FOR THE EAST COAST OF INDIA UNDER STORM CONDITIONS IN THE BAY OF BENGAL,
Karnataka Regional Engineering Coll., Suratkal (India).
J. Dattatri, and P. Vijaya Kumar.
Indian Journal of Meteorology and Geophysics, Vol. 25, No. 2, p 211-222, April 1974. 9 fig, 1 tab, 15 ref.

Descriptors: *Waves(Water), *Forecasting, *Storms, *Winds, *Asia, Ocean waves, Monsoons, Coasts, Shores, Wavelengths, Graphical analysis, Wind tides, Bays, Oceans, Estuaries, Friction, Fluid friction, Fluid mechanics, Tropical cyclones, Oceanography, Meteorology.
Identifiers: *India, *Bay of Bengal(India), *Wave prediction.

Cyclonic storms are frequent in the Bay of Bengal, particularly during the NE monsoon period. Some of these storms are severe and generate high waves which cause havoc in the coastal regions. This paper presented an analysis of the cyclonic storm which hit coastal Andhra Pradesh on 7 November 1969. Wave prediction under storm conditions involves an analysis of moving fetches and variable wind speeds. Wilson's graphical method incorporating the latest available wave prediction relations was used for wave prediction. The predicted waves which are deep water waves were modified to account for refraction, shoaling, and bottom friction effects as they enter shallower waters. The predicted waves were compared with the waves observed by the Visakhapatnam outer harbor authorities. The results of the analysis suggested that (1) Wilson's graphical method can be applied for wave prediction for Indian coasts under storm conditions, (2) the recommended value of bottom friction factor appears to be low, and (3) waves of considerable height are experienced even in areas not in the direct path of the cyclone. Lanchester Polytechnic, Coventry (England). Dept. of Civil Engineering.
J. P. Grubert.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 102, No HY7, Proceedings Paper 12255, p 955-967, July 1976. 7 fig, 1 tab, 13 ref, 3 append.

Descriptors: *Coastal engineering, *Estuaries, *Saline water intrusion, *Diffusion, *Tides, Hydraulics, Algorithms, Methodology, Computers, Mathematics, Mathematical studies, Equations, *Mixing.
Identifiers: *Well-mixed estuaries, *India, *River Hoogly, Double-sweep algorithm.

Tidal estuaries are classified, depending on the amount of mixing of the salt and freshwater, into three groups: well mixed, partly mixed, and fully stratified. The flow ratio given by the tidal prism divided by the river discharge during a flood tide exceeds unity for a well-mixed estuary. A numerical model was presented for the computation of flow variables in such an estuary. The numerical method used was an implicit, unconditionally stable, finite difference scheme of second-order accuracy. Data were presented for the scheme in a physically realistic way to avoid nonlinear instabilities, and, for this purpose, the dynamic equations were written in pentadiagonal form and solved with a generalized double-sweep algorithm. The method was applied to the River Hoogly estuary in India. (Singh-ISWS)

SUBMARINE MEANDERING THALWEG AND TURBIDITY CURRENT FLOWING FOR 4,000 KM IN THE NORTHWEST ATLANTIC MID-OCEAN CHANNEL, LABRADOR SEA,
McGill Univ., Montreal (Quebec). Dept. of Geological Sciences.
S. Chough, and R. Hesse.

Geology, Vol. 4, No. 9, p 529-533, September 1976. 6 fig, 21 ref.

Descriptors: *Atlantic Ocean, *Turbidity, *Turbidity currents, *Thalweg, Sediment transport, Sedimentation, Meanders, Oceanography, Oceans, Channel morphology, Channels.
Identifiers: *Labrador Sea, *Deep sea channel, *Submarine meandering thalweg, Mid-ocean channel.

For the first time, the existence of a meandering thalweg and associated point bars was documented in detail for a mid-ocean channel. It was found that in the world's largest deep-sea channel, the Northwest Atlantic Mid-Ocean Channel of the Labrador Sea, average meander wave length of the thalweg is 50 km between lat 54 degrees and 57 degrees 30 minutes N. The ratio of the meander wave length to channel width was less than that for alluvial channels. Sediments recovered from the channel and natural levees were indicative of sedimentary mass transport in the channel by turbidity currents and related processes, some of which probably extended the entire length of the channel. Identifiers: *Radiochemical testing, Surface sediments, Natural radioactivity, Nuclear fallout, Trace minerals, Analytical methods, Bismuth 214, Ruthenium 106, Radiochemical sampling, Natural radionuclides, Manmade radionuclides.

Natural and manmade gamma-ray emitting radionuclides were measured in Chesapeake Bay sediments taken near the Calvert Cliffs Nuclear Power Plant site. Samples represented several water depths at six locations for five dates encompassing a complete seasonal cycle. Radionuclide contents of dry sediments ranged as follows: T1208, 40 to 400 pCi/kg; Bi214, 200 to 800 pCi/kg; K, 0.04 to 2.1%; Cs137, less than 5 to 1900 pCi/kg; Ru106, less than 40 to 1000 pCi/kg; Co60, less than 1 to 27 pCi/kg. In general, radionuclide contents were positively correlated with each other and negatively correlated with sediment grain size. (Henley-ISWS)

OCEANOGRAPHIC APPARATUS,
General Dynamics Corp., St. L...is, Mo. (Assignee).
E. L. Casco, and R. F. Kosic.
U. S. Patent No. 3,968,954, 15 p, 12 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 948, No 2, p 566, July 13, 1976.

Descriptors: *Patents, *Instrumentation, *Oceans, *Sea water, Water properties, *Measurement, Temperature, Pressure, Conductivity, Oceanography.
Identifiers: Reeling systems, Reels, Sensors, Deployment and recovery.

The invention relates to oceanographic apparatus and particularly to a reeling system which is adapted to deploy and retrieve a sensor body which is attached to a line or cable so that measurements of ocean characteristics may be made through the use of the sensor. It is especially suitable for use in obtaining data from which a profile of ocean characteristics with respect to depth can be made. It is also suitable for use in other oceanographic apparatus in which cables or lines are deployed and retrieved. A cable, at the end of which is attached a sensor, is wound around a reel having a flange in which a spiral cam is formed. In order to deploy the sensor, the reel is adapted to tilt to a downward vertical position so as to permit free fall of the sensor and cable over the cam flange and through a fairlead which may be secured in and extending through the hull of an ocean data buoy. The reel is tilted to a horizontal position and rotated in order to retrieve the sensor, the cam flange guiding the cable onto the hub of the reel which may be rocked during winding so as to obtain a level wind on the reel hub. The fairlead protects the sensor once it is retrieved. During free fall, the weight distribution and shape of the sensor provides for stability and a constant drop rate. Data (such as temperature, pressure and conductivity) is transmitted to the surface via a conductor in the cable and using sea water as a return path. (Sinha-OEIS)

Descriptors: *Patents, *Sampling, *Water sampling, *Testing, *On-site investigations, *On-site tests, Suspended solids, Separation techniques, Oceanography.
Identifiers: Particulate separator.

Water samples in most investigations must be brought to the surface where particulate matter is separated, treated, and then lowered agin for a period of incubation at the natural depth environment. This procedure subjects the particulate matter sample to changing environmental conditions as well as to possible contamination. Since separation of the samples from the captured water is usually conducted in a laboratory, an additional opportunity for contamination is introduced. This invention, a sampling device for in situ oceanographic investigations includes a sample chamber in which water samples are received and exited by a dual-valve arrangement. The valves are messenger-actuated in two discrete steps, the first step involving actuating the sampler, filling its chamber with water, injecting a tracer solution, and allo... ing the particulate sample matter to incubate. T... second step, independently messenger-actuate... causes the release of compressed gas into t... chamber via a manifold, forcing the contain... water out through an appropriate filter after whi... the sampling device is recovered empty of all co... tents except whatever particulate matter has be... collected by the filter which matter is immediate... ready for laboratory analysis. MEAN HIGH WATER MARK AND USE OF TIDELANDS IN FLORIDA,
Florida State Dept. of Health and Rehabilitative Services, Vero Beach. Medical Entomology Lab.
M. W. Provost.
Fla Sci. 36(1), p 50-66, 1973.

Descriptors: *Florida, *Tidal waters, *Water levels, *Tidal marshes, Marshes, *High water mark.
Identifiers: *Tidelands.

An analysis of ocean tide patterns is used to explain the difficulties in determining the mean high water mark in Florida (USA). Seasonal oscillations of the sea are so related to tide intervals that a submergence periodicity on the tidelands is created which is unique to the state. The high marsh remains dry during 1 part of the yr and is almost continuously tide-flooded during the other. Important differences between Atlantic and Gulf coasts are demonstrated. The high marsh, located between mean neap high and mean spring high tide levels, occupies more of the tidelands in Florida than the low marsh. For the protection of tidelands it is recommended that they be delineated by their vegetation until more tidal bench marks are available.--Copyright 1975, Biological Abstracts, Inc.

WAVES IN COASTAL WATERS OFF MANGALORE; PT. I: DISTRIBUTION OF WAVE CHARACTERISTICS,
Naval Physical and Oceanographic Lab., Cochin India).
K. V. Sundara Raman, M. J. Varkey, P. K. Vijayarajan, V. C. John, and M. X. Joseph.
Indian Journal of Meteorology and Geophysics, Vol. 25, Nos. 3 and 4, July and October 1974. 7 fig, 1 tab, 13 ref.

Descriptors: *Waves(Water), *Pressure measuring instruments, *Ocean waves, *Measurement, On-site investigations, Data processing, Analytical techniques, Oceans, Bays, Coasts, Energy, Frequency, Oceanography.
Identifiers: *India, Wave heights, Wave periods, Energy spectra.

A pressure recorder for measuring sea waves had been installed off MangaLore. Wave record obtained from the recorder were analyzed, and wave parameters like period, height, etc., were obtained for the period June 1968 to May 1969. Frequency distribution of wave heights and wave periods during various months was drawn. Energy spectra obtained from data were presented. From the study of the distributions of wave parameters, it was found that period follows normal distribution, and the height follows Rayleigh distribution. The energy spectra were composite in nature, giving the average condition for a month when the record for the whole month was considered as a single record. (Sims-ISWS)

Cape Town Univ. (South Africa). Dept. of Zoology.
A. H. Fricke, and A. B. Thum.
Trans. Roy. Soc. S. Afr. Vol 41, Part 4, p 351-357, (1975). 3 fig, 13 ref.

Descriptors: *Shallow water, Equipment, *Temperature, Measuring instruments, *Reproduction, Animal behavior, Coasts.
Identifiers: South Africa, Parechinus angulosus, *Sea urchins.

The shallow inshore water masses around the Cape coast are mixed with regard to temperature and frequently experience marked fluctuations. We needed a device giving a continuous record of in situ temperature to investigate its effect on the reproductive behaviour of Parechinus angulosus Leske, a common local sea urchin. Commercial temperature recorders were enclosed in watertight housings designed for the purpose and installed on the sea-bed at the study sites. (South Africa)

PROCESS FOR EXTRACTING DISSOLVED SALTS FROM WATER,
Dames and Moore, San Francisco, Calif. (Assignee).
C. W. Garbe.
U.S. Patent No. 3,966,539, 4 p, 6 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2226, June 29, 1976.

Descriptors: *Patents, *Desalination, *Demineralization, *Separation techniques, *Evaporation, *Evaporation control, Water treatment, Saline water, Air-water interfaces, Settling basins, Thin films, Solar radiation.

A process is described for concentrating salt dissolved in a salt-saturated water by accelerated evaporation. It has been found that water evaporates rapidly from thin films in the range of 1 to 2 mils thickness which can be developed over a mixture of suspended solids in water. A particulate solid is selected having a density which exceeds that of the salt-saturated liquid and preferably exceeds the density of the salt-saturated liquid by a factor of about 2.0. The solid particulate matter is then mixed with the salt-containing solution to form a slurry. The atmosphere-exposed surface of the slurry is periodically agitated to produce a uniform mixture at the surface from which the suspended particles begin to settle, yielding the thin film of water. The film thickness increases as

the particle settlement progresses and achieves the optimum for evaporation. Agitation is effected periodically to prevent the formation of a dry surface skin over the slurry. When the concentration of the salt dissolved in the water within the slurry approaches the saturation level, agitation of the slurry ceases. Complete settlement of the solid particulate matter is then permitted. The liquid is then decanted from the top of the slurry close to its point of saturation, and is coventionally processed (by solar evaporation) to cause crystallization of the desired salt. (Sinha-OEIS)

MULTI-STAGE FLASH DISTILLATION PLANT,
Agency of Industrial Science and Technology, Tokyo (Japan). (Assignee).
T. Mukushi, K. Izumi, S. Takahashi, Y. Okazima, and T. Sawa.
U.S. Patent No. 3,966,562, 6 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2232-2233, June 29, 1976.

Descriptors: *Patents, *Desalination, *Sea water, Saline water, Separation techniques, Distillation, Flash distillation, Water purification, Equipment.

A multi-stage distillation plant consists of a multi-flash evaporator provided with a multi-flash chamber which is divided into a heat recovery section and a heat rejection section. The flash evaporator is provided with a deaerator for deaerating cold sea water, a thickener for separating brine containing a relatively great amount of seeds, from concentrated brine which has been extracted from a front chamber of the final stage flash chamber, and a seed mixing tank for obtaining a seed-mixed brine. Part of the sea water which has passed through the deaerator is supplied as a feed sea water to the rear chamber of the final stage flash chamber. The brine containing relatively great amount of seed and extracted from the thickener is joined to the seed-mixed brine fed from the seed mixing tank. Thus, the confluent brine thus joined together is discharged for deaeration into the final stage flash chamber from a distributor provided in the rear chamber. (Sinha-OEIS)

METHOD FOR PREVENTING SCALE IN SALINE WATER DESALTING APPARATUS AND SALINE WATER RECLAMATION APPARATUS FOR CARRYING OUT SAID METHOD,
Ishikawajima-Harima Engineering Review, Tokyo (Japan). (Assignee).
J. Sakuma, and S. Takahashi.
U. S. Patent No. 3,969,193, 5 p, 1 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 948, No 2, p 641, July 13, 1976.

Descriptors: *Patents, *Desalination, *Demineralization, *Saline water, *Waste water treatment, Scaling, *Descaling, Acids, Hydrogen ion concentration, Corrosion control.

A method for use in a flash distillation apparatus for saline water desalting is provided for removing the scale formed from saline water and accumulated upon the heating surfaces of the apparatus before the growth of the scale starts. During the time the desalting operation is being performed, an acid is added to the saline water for short periods at predetermined time intervals immediately before entering and/or in the course of the condensation and heating passages of the whole system of the condensation, heating and heat-recovery passage for saline water. The periodically introduced acid thereby repetitively dissolves and removes alkali scale formed upon the heating surfaces at the stage at which very fine nuclei of scale are formed. (Sinha-OEIS)

Descriptors: Aquatic habitats, Water temperature, Periphyton, Fish reproduction, *Weather modification, *Cloud seeding, *Utah, *Model studies, *Forecasting, *Ecosystems.
Identifiers: Spawn Creek(Utah), Logan(Utah), Logan Canyon(Utah).

In the past, considerable effort has been spent on the development of techniques for increasing precipitation from a given cloud formation. However, little attention has been given to identifying and evaluating the impacts of cloud seeding activities on the aquatic ecosystems within the affected areas. The objective of this study was to apply the simulation technique to predict the impacts of cloud seeding on the aquatic ecosystem within the area subject to weather modification. A small mountain watershed near Logan, Utah, was selected for the study. Measurements were made of the significant parameter levels under current conditions. A hydrologic and water temperature model was calibrated to the watershed to predict the change in water temperature and stream velocities from arbitrary increases in the snowpack. The predicted water velocities and temperatures were used to link the hydrologic system to the aquatic ecosystem which consisted of primary production, invertebrate, and fish communities. The study was conducted over a very short time base, and thus cannot be regarded as being absolutely conclusive, but the results do indicate trends which might be expected if various decreases of water temperature and increases in stream velocity were to occur.

Descriptors: *Cloud seeding, Weather modification, *Artificial precipitation, Aircraft, Cloud physics, Rainfall, Precipitation(Atmospheric), Weather, Statistics, Data processing, Watersheds(Basins), Reservoirs, Water resources, Meteorology.
Identifiers: *India, *Uttar Pradesh(India), *Rihand Reservoir(India).

A cloud seeding experiment, on operational basis was performed during August-September, 197 over the catchment area of the Rihand reservoir i the state of Uttar Pradesh, India. For unavoidabl reasons, it was not possible to seed on 27 day scattered throughout the experimental period. Th unseeded days were considered control days, an the unseeded areas adjoining the catchment wer considered control areas. The results of the experi ment were evaluated, and the analysis suggested rainfall increase in the seeded catchment area o over 17%. However, the increase was not con sidered to be statistically significant. (Sims-ISWS)

IS MAN CHANGING THE WEATHER.
National Center for Atmospheric Researc Boulder, Colo.
H. Lansford.
Lantern, Vol XXIII (4), p 2-5, (1974).

Descriptors: *Weather modification, Cloud see ing, Air pollution, Nucleation, Carbon dioxid Dust storms, United States.

There is increasing evidence that man is changi the weather. The author surveys some of the e

eriments and theories that shed light on this im-
ortant and possibly ominous development. He
oints out that cloud-seeding is not only done by
eathermen in weather modification experiments
t that pollutants from automobile exhausts and
om high flying jet aircraft, as well as dust from
dustry and agriculture perform unintentional
oud-seeding sometimes triggering terrific storms
d sometimes overseeding clouds to an extent
here all moisture particles become frozen nuclei,
aving insufficient moisture to make them grow
ger. The effect of carbon dioxide accumulation
the atmosphere, due to the burning of fossil
els and the so-called 'Greenhouse Effect' is also
scussed. (South Africa)

3C. Use Of Water Of Impaired Quality

WATER AND SALT DISTRIBUTION IN A SOIL UNDER TRICKLE IRRIGATION,
Arizona Univ., Tucson. Dept. of Soils, Water, and Engineering.
M. C. S. Leao.
Ph.D. Dissertation, 1975, 14 fig, 14 tab, 30 ref.

Descriptors: *Leaching, *Irrigation systems, *Soil-water-plant-relationships, *Irrigation effects, Permeability, Lettuce, Soil water, Salts, *Salinity, *Salt tolerance.
Identifiers: *Trickle irrigation.

A field study was conducted to determine water and salt distribution patterns in soil irrigated by pairs of double-chamber, perforated polyethylene tubes in two experiments: a water distribution and salt distribution experiment. Moisture profiles are presented for the various water distribution tests. Water movement in the soil was two to three times greater in the horizontal than in the vertical direction. Wetted soil volume showed a high positive correlation with both volume of water applied and with time of application. Salt accumulation occurred mainly at the soil surface between the irrigation tubes and away from the main root zone of the plants. The surface accumulation was followed by a leached zone. There were no significant differences in yield among plots receiving different treatments. The study indicated that trickle irrigation with water of high salt content is likely to cause a high surface concentration of salts. Application of extra amounts of water by the trickle system, or another method, is recommended to leach the soils to a depth below the crop root zone. (Jamail-Arizona)

SOIL-WATER-PLANT RELATIONSHIPS - IMPORTANT DESIGN CRITERIA FOR IRRIGATION-PLANNING, (GROND-PLANT-WATER-VERHOUDINGS AS BELANGRIKE ONTWERP-GEGEWENS VIR BESPROEIING-SBEPLANNING),
Stellenbosch Univ. (South Africa). Dept. of Agriculture.
H. W. Weber.
Tegnikon, No. 2, p 2-10, (1975). 2 fig, 2 tab.

Descriptors: Irrigation design, Irrigation systems, Brackish water, Crop production, Dissolved solids, Soils, *Soil-water-plant relationships, Design criteria.
Identifiers: South Africa, Soil clogging.

In arid climates the production potential of irrigated soils is perpetually being menaced by decline and eventual destruction. The causes are mainly (i) the use of low quality waters having a high content of total dissolved solids, for irrigation and (ii) over-irrigation. Both causes are closely interconnected and either can originate the other. The exploitable water resources of Southern Africa will progressively be absorbed by the growing economy and expanding municipal areas. Therefore, less and less water will in future be allocated to an irrigation agriculture hitherto accustomed to luxury consumption endangering the soil. The irrigation farmer will have to produce the same or even higher harvests with less water in order to comply with the requirements of a responsible and rational water use and, simultaneously, to check the further decline of the quality of his soils. A basic knowledge about the interactions between soils, plants and water within any given set of climatic conditions is an indispensable necessity. In a simple, non-technical language some of the more important factors involved and their interdependency as well as their use for the design of irrigation projects are given. (South Africa)

THE EFFECTS OF PRESSURE ON DOMESTIC WATER SUPPLY INCLUDING OBSERVATIONS ON THE EFFECT OF LIMITED GARDEN-WATERING RESTRICTIONS DURING A PERIOD OF HIGH DEMAND,
Johannesburg City Engineer's Dept. (South Africa).
D. S. Gebhardt.
Water SA., Vol 1(1), p 3-8, (1975). 6 fig, 2 tab, 1 ref.

Descriptors: *Domestic water, *Water demand, Water conservation, *Water utilization, Leakage, *Water pressure, *Water consumption, Water supply, Cities, Hydrostatic pressure.
Identifiers: South Africa, Johannesburg.

Water is precious in South Africa. Water engineers throughout the country are constantly considering ways of improving urban supply systems and of saving this rather scarce commodity. In Johannesburg one aspect of urban water conservation is receiving special attention, namely the effects of excessive pressure in reticulation systems on water wastage. The problem is to what extent such pressures contribute to the overall wastage of water and what steps could be taken to rectify the position. The author comes to the conclusion that changes in the pressure of supply have an immediate effect on consumption throughout the whole system. A rise of over 60% in pressure causes a 30% increase in consumption in a residential township. The results of leakage tests show that losses are proportional to pressure. (South Africa)

Descriptors: *Solid wastes, Energy, Economics, Fuels, Pyrolisis, *Municipal wastes, Waste treatment, *Recycling.
Identifiers: South Africa, *Waste recovery.

Municipal solid wastes are currently receiving attention as potential minor sources of energy. Wastes can make a contribution of the overall energy situation in four ways: directly, by combustion of wastes to produce energy; indirectly, by conversion to gaseous, liquid or solid fuels; by returning to the economy materials manufactured by energy intensive processes; and by providing a feedstock for the manufacture of materials normally produced from key energy resources such as oil. The advantages, disadvantages and economics of different processes in each of the above categories are compared and related to the South African situation. It is concluded that, in the medium to long-term, municipal solid wastes can make a small but significant contribution to this country's energy supplies. (South Africa)

3E. Conservation In Industry

AN EXPLORATORY STUDY OF POSSIBLE ENERGY SAVINGS AS A RESULT OF WATER CONSERVATION PRACTICES,
Oklahoma Univ., Norman. Bureau of Water and Environmental Resources Research.
G. W. Reid.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-260 490, Price codes: A07 in paper copy, A01 in microfiche. Completion Report, July 1976. 135 p, 12 fig, 28 tab, 25 ref. OWRT A-061-OKLA(1).

Descriptors: *Water conservation, *Energy, *Cost analysis, Water reuse, Waste disposal, Recycling, *Alternative water use, *Alternative costs, Municipal water.
Identifiers: *Household water conservation alternatives, Savings in water, Savings in energy.

The objective is to evaluate energy consumption from the use of various alternatives of water conservation practices. The amount of water saved from each alternative is first calculated. Then, from each of these potential water savings, the amount of energy involved and the economical effect of each alternative can be determined. This study includes comparisons of eighty-one possible household water conservation devices and reuse systems with conventional water use methods and comparisons of flow reduction from residential uses as results of the alternatives. Total monetary savings in energy of each alternative, associated with pumping, heating, transmission and operation for water production and wastewater treatment are compared with the total monetary savings in water of the water-saving devices. A cost-effectiveness analysis and the ratings of the conservation alternatives in terms of both energy and water saved are presented.

AVAILABILITY OF WATER FOR COAL CONVERSION,
Bureau of Reclamation, Billings, Mont. Upper Missouri Region.
P. Q. Gibbs.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. WR2, p 219-225, November 1976. 2 fig, 2 tab.

Descriptors: *Water supply, *Coals, *Water pollution, Aqueducts, Energy, Water sources, River basins, Water allocation(Applied), Storage, Diversion, *Great Plains, Energy conversion.
Identifiers: *Water availability, Energy companies, *Coal conversion.

Coal is abundant in the Northern Great Plains. Other forms of energy from converting coal require water. Sources where substantial water supplies are available are limited, but there are some that could serve Montana, Wyoming, and North Dakota. Sources are primarily in Upper Missouri River Basin and tributaries. The Yellowstone River Compact allocates water between Montana and Wyoming on four interstate tributaries. Existing storage impoundments are preferred. Locations, capacities, and streamflow are shown. Possible routes and cost of water conveyance have been determined in studies by the Bureau of Reclamation. Energy companies hold options to some stored waters. Ground water from Madison Formation deep beneath the Fort Union-Powder Basin Coal Region is possible as an alternative water source. Federal and state cooperation is required to make developments possible, and developers are required to satisfy environmental statues. (Bell-Cornell)

WATER CONFLICTS IN WESTERN COAL DEVELOPMENT,
Montana State Univ., Bozeman. Dept. of Civil Engineering and Engineering Mechanics.
T. T. Williams.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineering, Vol. 102, No. WR 2, p 327-339, November 1976. 4 fig, 6 tab, 10 ref.

Descriptors: *Coal mines, *Water resources, *Water allocation(Policy), *Land use, *Energy, Mining, Montana, North Dakota, Wyoming, Strip mines, Water utilization, Irrigation, Water rights.
Identifiers: *Water conflicts.

Coal development is increasing rapidly in the Northern Great Plains. Strip mining in the Montana, North Dakota, Wyoming Fort Union region may reach 977,000,000 tons per year by the year 2000. Water requirements for surface strip mining are negligible, but significant quantities are required for conversion processes. Using the fastest rate of production currently projected, a total of 800,400 acre-ft per year could be needed. This much water is available in the region, but the major conflicts which exist are: new storage reservoirs may be required to provide the water when needed; possible agricultural development may need all the water that can be made available; fish and wildlife needs, recreation uses, and environmental preservation may preclude development. WATER AVAILABLE FOR ENERGY--UPPER COLORADO RIVER BASIN,
Utah State Engineer's Office, Salt Lake City.
D. C. Hansen.
Journal of the Water Resources Planning and Management Division, Vol. 102, No. WR2, Proceedings of the American Society of Civil Engineers, p 341-348, November 1976. 1 tab, 5 ref.

Descriptors: *Colorado River, *Water resources, *Water rights, *Energy, Water supply.
Identifiers: Regional planning.

The Upper Colorado River Basin has abundant deposits of fossil fuels and minerals, and numerous projects are in progress, planned or projected, to extract these resources. The first question that needs to be answered to make it possible for these projects to become reality is the availability of water. The Upper Colorado River Basin states are presently depleting 60% of the water apportioned to them under the Colorado River Compact of 1922. Of the 40% remaining it is difficult to specify the exact amount of water available for future development because of the uncertainty of the amount of water needed to satisfy the Indian water rights and the amount of water that has been committed to various projects by the Upper Colorado River Basin states. A joint effort between Federal, state, and Indian leaders is needed to make water available for energy development and to insure that all Indian water rights are satisfied. (Bell-Cornell)

POWER AND WATER FOR SOUTH WEST AFRICA,
South West Africa Water and Electricity Corp. (Pty) Ltd., Windhoek.
A. D. W. Wolmarans.
The Professional Engineer, Vol 4(4), p 5-1 (1975).

Descriptors: *Water supply, *Water demand, *Hydroelectric power, *Africa, Water resources development, Future planning(Projected), Electrical power industry, *Electrical power production.
Identifiers: *South West Africa, Southern Africa, Kunene River, Okavango River, Gove Dam, Caleuque Dam, Ruacana Falls, Ovambo.

A description is given of the background, origin, growth, present position and immediate future of the South West Africa Water and Electricity Corporation (Pty) Ltd. (SWAWEK) in its endeavour to stimulate the growth and development of the territory of South West Africa. The further development of the enormous potential of the Kunene River and in addition, the development of the potential of the Okavango River not only for the generatio of electrical power but also for the supply of water, will expand the infrastructure necessary for the future development of the territory of S.W.A. (South Africa)

SCOM PIONEERS DRY COOLING,
J. Sheer.
onstruction in Southern Africa, Vol. 20(2), p 35-
, (1975).

escriptors: *Thermal powerplants, Water quirements, Water conservation, *Cooling wers, Design, Operations.
entifiers: *South Africa, *Transvaal, *Dry cool-g.

description is presented of the design and opera-on of the South African Electricity Supply Com-ssion's (ESCOM) dry-cooling tower system for 200 megawatt turbo-generator set at Grootvlei wer Station in Transvaal. This type of cooling stem, which is still in the prototype stage in veral countries, has a promising future in both ssil-fuelled and nuclear power stations. The com dry-cooling tower is presently the largest erating dry tower in the world, dissipating heat the atmosphere at a rate of 330 megawatts. A scription is presented the influence of various nospheric conditions on the performance of the wer, mention is made that no significant corro-on of the heat exchanger has occurred and that erating staff have not encountered any control maintenance difficulties. E IMPACT OF INCREASED ENERGY STS ON WATER USE AND AGRICULTURAL TPUT IN NORTHWESTERN OKLAHOMA,
lahoma State Univ., Stillwater. Dept. of ricultural Economics.
P. Mapp, Jr, and V. R. Eidman.
ailable from the National Technical Informa-n Service, Springfield, VA 22161 as PB-260 487, ce codes: A05 in paper copy, A01 in microfiche. mpletion Report, September 1976. 95 p, 9 fig, 27 tab, 28 ref. OWRT A-057-Okla(2), 14-34-0001-6037.

Descriptors: Irrigation, Energy, Surface-groundwater relationships, *Economics, *Farm management, *Irrigation systems, *Irrigation efficiency, Drawdown, Aquifers, *Deep-well pumping, Overdraft, Water table, *Cultivation, Zone of saturation, Fuels, Economic impact, Costs, Farm prices. Identifiers: Reduced tillage, Natural gas, *Energy conservation, Fossil fuels.

This study was designed to (1) identify production practices which reduce tillage operations, resulting in reduced fossil fuel energy use and increased net returns, (2) determine optimum organizations of production for representative farms maximizing net returns and maximizing net kilocalories of output, and (3) evaluate the impact of rising natural gas prices on optimum organizations of production for farms in alternative resource situations under low and high crop prices. Reduced tillage methods increase both net returns and net kilocalories of output. Organizations of production obtained when maximizing net kilocalories of output require more fossil fuel inputs per farm, result in a shift to crops that utilize the forage as well as the grain produced and lead to negative net returns. Rising natural gas prices have several potential effects. First, they increase the cost of pumping and, other things equal, reduce the level of net returns associated with irrigated crop production. Second, shifts from high to moderate levels of irrigation occur under constant and increasing natural gas prices due to changes in the water table and pumping costs over time. Third, rising natural gas prices result in a more rapid return to dryland farming and a two-thirds reduction in net returns.

DRIP IRRIGATION: ISRAEL TEACHES CALIFORNIA,
A. Marquis.
The Nation, Vol 220, p 403-4, April 5, 1975. 2 p.

Descriptors: *Water distribution(Applied), *Foreign countries, *Water yield improvement, *Irrigation design, *Irrigation efficiency, Irrigation systems, Irrigation engineering, Crop response, Drainage effects, Farm management, Irrigated land, Water control, Distribution systems, Sprinkler irrigation, Furrow irrigation, California. Identifiers: *Drip irrigation, Israel.

Drip irrigation, with its many benefits and few liabilities, seems to be the agricultural wave of the future. The basic idea, evolved over the past 15 years, is to dribble water at the rate of about a gallon per hour directly to the plant roots, rather than spray as much as 60 gallons per hour into the air or channel streams into furrows where perhaps half is lost to evaporation. Among the benefits are: (1) brackish water can be used in a drip system; (2) secondary effluent from a sewage treatment plant can be used; (3) plums and oranges will flourish on half the water; (4) land that was either too rocky or too steep can now be brought under cultivation; (5) costs drop dramatically; and (6) fertilizer can be added to the water. The major problem is the clogging of dispersal heads, but this is being worked out with the help of better filters. Prospects for use in developed countries are excellent; however, where labor is cheaper than the cost of introduction of this system ($600 per acre), the switch to drip irrigation is a long way off. (Frank-Florida)
W77-01080

NON-SIDE-SPLASH WATER SPRINKLERS,
M. Drori.
U.S. Patent No. 3,966,122, 7 p, 7 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2093, June 29, 1976.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation practices, *Irrigation efficienty, Distribution systems, Water distribution(Applied), Application equipment.

The object of the invention is to provide a new arrangement for preventing or reducing side-splash in water sprinklers. The non-side-splash feature can be applied to various standard sprinkler head constructions, requiring merely a simple and inexpensive modification to adapt them for the non-side-splash function. The sprinkler includes a splash guard carried by the sprinkler head at a location to be impinged by the water splashed laterally from the drive member to substantially block side-splash. Also the rotational axis of the sprinkler head is substantially aligned with the general vicinity of impingement of the water splashed against the splash-guard such that little or no rotary torque is applied to the sprinkler head. DRIP IRRIGATION DEVICE,
R. L. Hendrickson.
U. S. Patent No. 3,968,930, 4 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 948, No 2, p 557, July 13, 1976.

Descriptors: *Patents, *Irrigation, *Irrigation practices, *Irrigation efficiency, *Flow control, *Flow restriction water, Distribution(Applied), Application equipment, Water control.
Identifiers: *Drip irrigation.

A flow restrictor fitting for use in drip irrigation can be connected between two lengths of hose and when used in series with a number of lengths of hose provides means for irrigating areas by emitting small drips at each of the fittings to minimize waste of water. The central core member has a portion adjacent one end that is enlarged in outer diameter. This enlarged portion has a helical rib or thread defined on the outer surface and adjacent one end has an opening from the central passageway to the outer surface having the helical rib. A shell or cover member is threadably mounted onto the central core member and has a generally cylindrical inner surface that surrounds the helical rib and provides an enclosed helical flow restriction channel or passage. An opening is provided from the through passage of the core member to the helical rib so that water can flow in the recesses between the ribs along the length of the helix so that only a small, controlled drip of water will be emitted. The device is manufactured from plastic materials. (Sinha-OEIS)
W77-01213

PIPE-FOLLOWING IRRIGATION MACHINE,
Wright Rain Ltd., Ringwood (England). (Assignee).
V. B. W. Harvey.
U.S. Patent No. 3,970,102, 15 p, 9 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 948, No 3, p 953, July 20, 1976.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, *Irrigation practices, *Irrigation efficiency, Water distribution(Applied), Conveyance structures, Water conveyance, Automatic control.

An irrigation machine has traction wheels which run along the top of a pipe having self-closing hydrants spaced apart in the length of the pipe. The machine is guided to follow the course of the

pipe. When the machine reaches a hydrant, the machine stops and a vertically-movable riser pipe in the form of a probe and connected to a water gun or other water distribution device automtically descends to open the hydrant valve and thus admit water to the riser pipe and to the water gun. The machine is fitted with a device which shifts the machine longitudinally of the hydrant as the riser pipe is lowered towards the hydrant so that when the probe end of the riser pipe enters the hydrant, the probe end will be in precise vertical alignment with the hydrant. After a predetermined time the riser pipe is raised, the hydrant valve closes and the machine travels along the pipe to the next hydrant. (Sinha-OEIS)

PIPE INSERTABLE EMITTER FOR IRRIGATION SYSTEMS,
Harmony Emitter Co., Inc., Tucson. Ariz. (Assignee).
R. C. Harmony.
U.S. Patent No. 3,970,251, 5 p, 4 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 948, No 3, p 1005, July 20, 1976.

Descriptors: *Patents, *Irrigation, *Irrigation practices, *Irrigation efficiency, *Flow control, Water distribution(Applied), Application equipment, Erosion.
Identifiers: Emitters.

An emitter is provided which delivers a constant flow of water despite variations in the water pressure. A number of emitters are inserted along a water distribution line, each of which are self regulating to provide a constant water discharge rate regardless of the location along the line. The emitters can be replaced and require no adjustment to control the rate of water flow. They are usable with irrigation water having suspended particulate matter. The emitter is formed of the following elements: a base for conveying water from within the water distribution line and having a depending hollow shroud for penetrating the wall of the water distribution line; an apertured diaphragm mounted on the base for establishing a water discharge outlet; bias means for maintaining a constant rate of water and comprising a pair of opposed surfaces separable from one another for defining a single passageway for the water flow; and a cap for securing the diaphragm to the base. (Sinha-OEIS)

SOIL NITRATE LOSS DURING IRRIGATION: ENHANCEMENT BY PLANT ROOTS,
California Univ., Berkeley, Coll. of Natural Resources.
M. G. Volz, M. S. Ardakani, R. K. Schulz, L. H. Stolzy, and A. D. McLaren.
Agronomy Journal, Vol. 68, No. 4, p 621-627, July-August 1976. 6 fig, 1 tab, 31 ref.

Descriptors: *Nitrates, *Denitrification, *Irrigation effects, *Root systems, *Soil-water-plant relationships, Nitrogen, Nitrites, Absorption, Organic matter, Soil analysis, Soil microorganisms, Bacteria.

The effects of a root system on nitrate loss from soil solution during irrigation of two Hanford sandy loam plots, one fallow and the other planted with barley (Hordeum vulgare), are reported. Plots were ponded for 44 hours with a solution containing 100 ppm N and 46 ppm C1- (tracer for NO-3) as KNO3 and CaC12, respectively. Nitrate-nitrogen concentrations during irrigation were lower in most soil solution samples from 0 to 60 cm under barley than in those from fallow plosts, but C1-concentration profiles were the same to a depth of 45 cm. During the later irrigation period, nitrate losses due to microbial use of NO-3 under barley were almost 90% of the total. This is probably due to stimulation of dissimilatory nitrate and nitrate reduction by both organic C exuded from barley and a decreased soil redox potential. (Jahns-Arizona)

ENERGY SOURCES FOR IRRIGATION PUMPS IN NORTHWESTERN NEW SOUTH WALES,
University of New England, Armidale (Australia). Dept. of Geography.
J. J. J. Pigram.
Australian Geographical Studies, Vol. 13, No. 1, p. 85-93, April, 1975. 3 fig, 4 ref.

Descriptors: *Irrigation efficiency, *Irrigation operation and maintenance, *Pumping, *Natural gas, Fuels, Maintenance costs, Electric power costs, *Australia, Irrigation systems, Arid lands.
Identifiers: Diesel power, *New South Wales.

Since only nominal charges are levied for irrigation water in northwestern New South Wales, the major expense incurred in irrigation is the cost of pumping. The use of diesel fuels, electric power or natural gas is evaluated. Diesel has been preferred because it was more readily available. Although the cost of fuel for a diesel engine may be considerably less than the cost of electricity for a motor developing the same horsepower, a true comparison of operating costs should take into account lubrication requirements, maintenance, and interest and depreciation, among other factors. While electricity is gaining on diesel power for use in irrigation pumping, a new source of power, natural gas, has been discovered in commercial quantities in Australia and should prove to be an ideal source for irrigation pumping. A NOTE ON THE USE OF BENTONITE CLAY AS A SUB-SOIL MOISTURE BARRIER FOR VEGETABLE PRODUCTION ON DRYLANDS OF RAJASTHAN,
Central Arid Zone Research Inst., Jodhpur (India).
R. P. Singh, H. P. Singh, and K. C. Singh.
Annals of Arid Zone, Vol 14, No 1, p 63-66, 1975. 2 tab.

Descriptors: *Crop response, *Bentonite, *Vegetable crops, Percolation, *Clays, Crops, Sands, Moisture content, Water utilization, Soil profiles, Soil moisture, Soil types, Soil water, Return(Monetary).
Identifiers: *Rajasthan, *India.

Experiments were conducted on several vegetable crops to test the efficacy of bentonite clay in reducing deep percolation losses and increasing vegetable yields on the drylands of Rajasthan. Vegetable growers generally dig pits to prepare localized seed beds for planting Cucurbits. Pits of 30-35 centimeters in diameter were dug on sandy loam soil, and bentonite and FYM incorporated at different depths. Pits having the bentonite barrier exhibited higher moisture content at harvest and greater yield than the controls in the case of all vegetable crops tried. In the case of kakri, the yield differences show an interesting trend in that the vegetable yield increases with the depth of incorporation of the amendments. Use of bentonite results in substantial cost savings. (Jamail-Arizona)

RESPONSE OF WHEAT UNDER SUB-HUMI IRRIGATED CONDITIONS TO ATMOSPHERI MISTING DURING GRAIN FILLING,
International Maize and Wheat Improvement Ce tre, Londres (Mexico).
D. R. Laing, and R. A. Fischer.
Agricultural Meteorology, Vol. 15, p 285-29 1975. 4 fig, 2 tab, 9 ref.

Descriptors: *Mist irrigation, *Wheat, *Cr response, *Sub-humid climates, *Plant growth, rigation, Cereal crops, Grains(Crops), Cr production, Xylem, Water storage, Leaves, St mata, Moisture stress, Soil water, Growth rat Moisture content, Thermal stress.

Atmospherically-induced plant water defi and/or high temperature effects have been post lated as possible limitations to grain yield in rigated sub-humid environments. An experime was conducted in northwest Mexico to test t hypothesis, using a high yielding dwarf variety wheat grown under intensive irrigation. Misti during grain filling was automatically activated ear temperatures above 25 degrees centigra Leaf relative water content and xylem wa potential for the control and misted areas we measured. Stomatal resistance measurements dicated no difference between the two treatme throughout a diurnal cycle. Grain growth rate w slower in the misted treatment, apparently a result of lower ear temperature. Treatments h no effect on final grain size and yield. Atmosphe cally-induced stress did not appear to limit gr yield under the meteorological conditions perienced during this experiment. (Jam Arizona)

scriptors: *Fertilizers, *Irrigation, Soil water vement, Agriculture, Crop production, trients, *Irrigation systems, Fertilization. ntifiers: South Africa, *Ferti-irrigation, licro-irrigation systems.

rti-irrigation, simultaneous irrigation and fer- sation in local orchards and vineyards, has been de possible by the installation of permanent cro-irrigation systems and the availability of h-grade, completely water-soluble fertiliser terials. Ferti-irrigation, as a standard orchard ctice, is becoming more popular. Most produ- s allow for incorporation of a permanent or rtable fertiliser tank at the control centre of ch irrigation block. Ferti-irrigation offers the oducer the following advantages over conven- nal fertilisation practices: Localised placement plant nutrients, movement of applied nutrients o the root zone, labour saving, and continuous pply of the required plant nutrients during the wth season. However, this technique can only utilised economically and effectively when naged correctly. This report aims to illustrate advantage gained from, and pitfalls ex- ienced with, local ferti-irrigation. (See also 7-01394) (South Africa)

DISCHARGE CHARACTERISTICS OF SPACED SLITS IN POLYETHELENE PIPES UNDER PULSATING PRESSURE CONDITIONS,
Pretoria Univ. (South Africa). Dept. of Agricultural Engineering.
D. S. van der Merwe, and B. J. Grobler.
Water S A., Vol 1 (3), p 102-108, (1975). 10 fig, 1 tab, 2 ref.

Descriptors: *Plastic pipes, *Drip irrigation, Pressure conduits, *Discharge measurement, Pressure head, Temperature, Water temperature.
Identifiers: South Africa.

Slits in a polyethelene pipe, under pulsating pressure conditions, were investigated as a possible dripper for drip irrigation. A prerequisite for the practical implementation of slits is that cutting of the slits should be as simple as possible. An apparatus for cutting the slits was designed and tested. It appeared that the discharge from a slit under pulsating pressure conditions is mainly influenced by the pressure head during the discharge period, the duration of the discharge period, and the pulsation rate. There were indications that the temperature of the water has an important effect on the discharge, the extent of which will have to be determined. The effect of slit orientation on the discharge characteristics was also investigated. Three orientations were used, and it was clear that slits parallel to the longitudinal axis of the pipe was the only orientation suitable for practical use. (South Africa)

CONVENTIONAL AND CONTROLLED- RELEASE NITROGEN SOURCES FOR RICE,
Arkansas Agricultural Experiment Station, Stuttgart. Rice Branch Experiment Station.
B. R. Wells, and P. A. Shockley.
Soil Science Society of America Proceedings, Vol. 39, No. 3, p 549-551, May-June 1975. 3 tab, 8 ref.

Descriptors: *Soils, *Fertilizers, *Fertilization, *Ureas, *Nitrogen, *Rice, Crop production, Crop response, Water pollution sources, Absorption, Path of pollutants.

Tests were conducted for the years 1967-1972 with rice to compare various formulations of sulfur-coated urea (SCU) and iso-butylidene diurea, (I.B.D.U.) with urea and ammonium sulfate as nitrogen sources on both silt loam and clay soils. The N sources were applied either preplant or top-dress at rates up to 235 kg/ha to drill-seeded rice which was flooded at approximately 2 weeks following seedling emergence. Grain yields, dry weight, and N uptake indicated that the controlled-release N sources could be used to regulate rate of N supply to the plant throughout the growing season. Growth of direct seeded rice was slowed considerably during the early part of the growing season due to the slow rate of N release but grain yields were not drastically altered. Grain yields on the silt loam soils following use of the controlled-release N fertilizers were consistently equal to those following use of urea or ammonium sulfate. On the clay soils under intermittent flooding, use of SCU resulted in increased yields as compared to urea applied preplant, and in one year resulted in increased yields as compared to urea applied in split topdress doses. Both SCU and I.B.D.U. were suitable N sources for rice growing under the water management systems employed in these studies. (Skogerboe-Colo St)

Melbourne and Metropolitan Board of Works (Australia), Water supply, Sewerage and Drainage Branch.
Report No. MMBW-W-0052, October 1975. 9 p., 10 fig., 6 tables, 5 ref. Kesari, N., and Panagiotopoulos, P. (comp.).

Descriptors: *Design flood, *Flood recurrence interval, *Frequency curves, *Australia, Flood flow, Control structures, Design data, *Flood forecasting.
Identifiers: *Yarra River(Vic).

In cases where there are no streamflow data available at or in the vicinity of a proposed water control structure, the magnitude of a flood of predetermined recurrence interval derived from a regional frequency curve may be used for design purposes. For the Yarra catchment (Victoria, Australia) such a regional curve was derived in 1969; a revised curve is presented using additional data to 1973, and with some alterations in method. The methods and data used in the revision are described in detail. (CSIRO)

DEVELOPING OPTIMAL OPERATING RULES FOR FLOOD PROTECTION RESERVOIRS,
Karlsruhe Univ. (West Germany). Institut fuer Wasserbau III.
G. A. Schultz, and E. J. Plate.
Journal of Hydrology, Vol. 28, No. 2/4, February 1976. p 245-264. 10 fig, 2 tab, 5 ref.

Descriptors: *Flood control, *Reservoir releases, *River systems, *Dynamic programming, *Analog computers, Optimization, Decision making, Algorithms, Equations, Systems analysis, Mathematical models.
Identifiers: *Operating rules, *Danube River(W Germany).

During recent decades, a considerable increase o flood damage costs has been observed in variou Central European countries, due mainly to th faster growth than the average population densit of the larger cities and industrials districts alon the main streams. The only means of reducin flood damage is by constructing flood protectio reservoirs in the upper reaches of the rivers. It i vital to utilize the limited retention space most ef ficiently, to be accomplished through controlle reservoir releases to minimize overall catchmen flood damage. This optimization problem is con sidered herein using a real world example on th Danube River. Examined are two different ap proaches to the problem: (1) development of nea optimum reservoir release strategies which wi lead to acceptable results without havin forecasts, utilizing an electrical analog computer and (2) development of optimum release strategie applicable for each single storm event using th dynamic programming method on a digital com puter. For the special system and flood under con sideration, parallel reservoirs are shown to be suit its purpose. (Bell-Cornell)

PUMPING POLICIES IN WATER SUPPLY,
Water Research Association, Marlow (England).
R. P. Donachie, K. Howard, P. A. Mawer, and T. Wyatt.
Journal of Hydrology, Vol. 28, No. 2/4, p 359-37 February 1976. (Published in Amsterdam) 5 fig, tab, 4 ref.

Descriptors: *Water supply, *Pumpin *Operating costs, *Optimization, *Schedulin Stochastics processes, Dynamic programmin Resource allocation, Water distribution(Applied

ervoirs, Constraints, Regression analysis, ar programming, Systems analysis, Mathecal models.
tifiers: *Cost minimization, Gradient search od, Mixed-integer programming, Control , Electricity tariffs, United Kingdom.

rge part of total operating expenses in water ly is attributable to pumping, thus providing a g incentive for the optimization of pumping dules. The need for optimal pumping dules arises in systems of widely different acteristics. This paper considers three comly occurring system types: resource systems r stochastic inputs; resource allocation to iple demand areas; and distribution systems. n of these system types calls for different solumethods. The paper emphasizes the imance of adequately modeling all significant res of the real system whilst at the same time ning acceptable computing costs. For the first m type, dynamic programming and the ient search method are both found to derive -cost control rules under which the system behave according to preset long term objec. The second system can be optimized utilizixed-integer programming. Finally, the third m problem is solved by using regression anal and a hill-climbing technique to reduce the mum demand for electricity at each pumping n. (Bell-Cornell)

GRESS IN THE EXPLORATION AND IN SCIENTIFIC RESEARCH OF THE LIBYAN ERT SINCE GERHARD ROHLFS,
gart Univ. (West Germany).
W. Meckelein.
Annals of the Geological Survey of Egypt, Vol. 5, p 47-60, 1975. 1 fig, 88 ref.

Descriptors: *Deserts, *Africa, *Exploration, *Land reclamation, *History, *Water resources development, Topography, Arid climates, Geologic investigations, Groundwater, Cultivation, Land use.
Identifiers: *Libyan Desert, Gerhard Rohlfs, Oases.

A history is presented of exploration of the Libyan Desert, especially since the Gerhard Rohlfs expeditions of 1873-74, and the scientific data collected by such exploration. The progress of cartography, history of climate, geomorphology and groundwater research pertaining to this region are discussed. Land reclamation has been carried out in the northern and northeastern border zones of the desert, such as the Siwa oasis and near the western Nile delta. Cultivation has been successful, and the desert landscape has been changed by new settlements and roads. However, the output and pressure of wells has declined, and pumping is increasingly necessary. Other problems are increasing salinity, often in the best soils, and moving sands which threaten fields and road traffic. Also discussed are possible projects for agrarian land use and/or industrialization given economic and environmental limitations. (Jahns-Arizona)

RANGELAND DEVELOPMENT AND MANAGEMENT IN WEST RAJASTHAN,
Central Arid Zone Research Inst., Jodhpur (India).
L. D. Ahuja, and H. S. Mann.
Annals of Arid Zone, Vol. 14, p. 29-44, 1975. 2 tab, 33 ref.

Descriptors: *Range management, *Water conservation, *Soil conservation, *Pasture management, *Forages, Range grasses, Stock water, Deserts, Livestock, REvegetation, Drought, Arid lands, Brush control, Stabilization, Grazing, Animal control.
Identifiers: *Rajasthan, *India.

Range and pasture development in the arid zone of Rajasthan, while potentially very good, involves development and conservation of soil and water resources, and selection of the more productive, palatable and drought resistant plants to provide the required food. Various techniques for management and improved utilization of rangelands and pastures are presented and evaluated. A major problem in the interior areas of the desert is lack of drinking water for livestock. Drinking water requirements for range animals are presented. For good livestock production and improvement of the economy of the arid regions, rational use of the pasture is essential. (Jamail-Arizona)

MECHANICAL CONTROL OF EURASIAN WATERMILFOIL IN MARYLAND WITH AND WITHOUT 2,4-D APPLICATION,
Maryland Univ., Solomons. Chesapeake Biological Lab.
C. K. Rawls.
Chesapeake Science, Vol. 16, No. 4, p. 266-281, 1975. 2 fig., 4 tab., 27 ref.

Descriptors: *Integrated control measures, *Aquatic weed control, *Chesapeake Bay, Mechanical control, *Maryland, *2,4-D, Herbicides, Salinity, Growth rates.
Identifiers: *Eurasian watermilfoil, 2,4-D butoxyethanol ester, 2,4-D iso-octyl ester.

Eurasian watermilfoil (Myriophyllum spicatum) is a major nuisance in the upper part of Chesapeake Bay. Between 1961-1964 studies were made in Herring and Dundee Creeks to determine effective control methods. Normally milfoil reached the surface by early May and began to sink in high salinity waters about September 15 and in lower salinities about October 15. Mowing usually had to be repeated at least monthly during the growing season from mid-May to mid-September. Mowing was only effective for the season in which it was made. New nodal growth from cut milfoil stems or fragments made mowing impractical for large areas. If cutting was followed by herbicide application when new growth offered sufficient vegetative containment of applied 2,4-D impregnated attaclay granules, the vulnerable period of milfoil to 2,4-D was extended beyond anthesis. The 2,4-D butoxyethanol ester was more effective than the iso-octyl ester. No adverse effects to endemic fauna and flora were observed. Submersed waterfowl food plants, retarded by the milfoil overstory, grew rapidly when milfoil was thinned or removed. (Buchanan-Davidson--Wisconsin)

IDENTIFYING URBAN FLASH FLOODING PROBLEMS,
Washington Univ., St. Louis, Mo. Dept. of Technology and Human Affairs.
W. P. Darby, and M. J. Small.
Journal of the Water Resources Planning and Management Division, Vol. 102, No. WR2, Proceedings of the American Society of Civil Engineers, p 349-363, November, 1976. 2 fig, 7 tab, 1 equ, 13 ref.

Descriptors: *Flash floods, *Flood control, *Land use, *Statistical methods, *Streams, *Watersheds(Basins), Floods, Forecasting, Runoff, Mathematical models, Planning, Systems analysis, Methodology.
Identifiers: *Urban development, Water plans, Multiple discriminant analysis.

The focus of flood control activities in urban areas has been the alleviation of problems associated with major river flooding. Meanwhile, unplanned urban development has caused flooding problems of small streams to worsen, and eventually to

receive priority attention. Because of limited resources, flood control agencies must choose individual streams for immediate attention, while deferring flood control action on others. Very little direct information exists upon which to base an evaluation of the relative flash flooding problems of individual streams. A methodology, based on multiple discriminant analysis, is presented to provide a decision-making tool to establish flash-flood control priorities among a number of urban streams. The analysis is based on indirect measures of flash flooding problems (land-use characteristics of the watershed, stream configuration, etc.) that are readily available to the flood control agency, instead of flood damages inventories and hydrologic data, which are often unobtainable. Using the discriminant models, individual streams can be singled out for priority action. (Bell-Cornell)

Identifiers: South Africa, Flood retention basins, Cross flow patterns, Crosslinking.

A cell-type mathematical model has been developed for routing of floods through complex river systems in which due account must be taken of storage attenuation effects, cross channel flow and flow reversals between channel and side-valley storage. Finite difference solutions of the simplified energy and continuity equations have been tested for stability and the model is ready for field calibration. It is intended as an aid to improved flood plain management. (South Africa)

A HYDRO-ECONOMIC EVALUATION OF FORESTRY IN THE EERSTE RIVER CATCHMENT,
Department of Forestry, Pretoria (South Africa).
D. W. Van Der Zel, and P. C. De Villiers.
Forestry in South Africa, No. 16, p. 19-26, (1975). 2 fig, 6 tab, 13 ref.

Descriptors: Forest watersheds, Forest management, River basins, Watersheds(Basins), River flow, Economics, Mathematical models, Water yield, Africa, Watershed management.
Identifiers: *South Africa, *Eerste River.

The present and possible future place of forestry in the Eerste River Catchment is illustrated and evaluated by a number of economic and hydro-economic formulae. It is shown that an area of 5000 ha of unused mountain land is available for forestry. An area of 3500 ha could be afforested and could add an annual R300 000 to the gross regional product (G R P). A mathematical model is developed from the evaluations to show that water use of the present situation on a forestry farm in the upper catchment of the Eerste River does not differ from that of the optimum mixed farming recommendation. Forestry in catchment areas in the Western and Southern Cape is justified and can be practised without detrimentally influencing other land owners in, or the water yield from such catchments. Descriptors: Geologic investigations, Interbasin transfers, Water demand, Shafts, Tunneling, Hydroelectric plants, Pumped storage, Contracts, Hydraulic aspects, Rivers.
Identifiers: Tugela River, Vaal River, *South Africa.

A description is presented of the Tugela-Vaal Scheme in which water from the Tugela River is pumped over the Drakensberg escarpment to the Vaal River, which serves the major South African urban and industrial expansion areas, and has virtually reached its limit. The Scheme not only supplies water to the Vaal River but, making use of the pumped storage principle, generates 1000 MW of peaking power for the national electricity network. A description is given of the geological survey that preceded the excavation of the large underground cavern situated 195 m below ground level, which will be the machine hall, as well as details regarding the shafts and tunneling that coincided with the operation. Descriptors: *Artificial recharge, *Recharge ponds, *Perched water, *Water table, *Groundwater recharge, Groundwater, Permeability, Porous media, Hydraulics, Mathematical studies, Analysis, Aquifers, Saturated flow, Aquitards, Dupuit-Forchheimer theory, Equations.

Perched mounds develop beneath artificial groundwater recharge basins where one or more horizontal semipervious layers are located below the basin. The shape of perched mounds was investigated by use of the saturated flow equations and the Dupuit-Forchheimer approximation. Finite difference techniques were used to solve for the mound shape under rising and steady-state conditions beneath strip and circular basins. Analytical solutions were obtained for certain limiting conditions. Results for the maximum mound thickness were presented in the form of dimensionless curves involving permeability of semipervious layer and the soil above the layer, thickness of layer, effective porosity and recharge rate from the basin. The equations and assumptions used for a single layer were also used for a multiple layer situation. A computer program was developed for a three layer case, and its use was illustrated with a numerical example. (Adams-ISWS)

Descriptors: *Aquifers, *Management, *Groundwater, *Linear programming, *Optimization, Wells, Distribution, Pumping, Decision making, Methodology, Constraints, Mathematical models, Equations, Systems analysis.
Identifiers: *Finite differences, *Steady-state flow.

The equations of transient and steady-state flow in two-dimensional artesian aquifers are approximated using finite differences. The resulting linear difference equations, combined with other linear physical and management constraints and a linear objective function, comprise a linear programming (LP) formulation. Solutions to such LP models are used to determine optimal well distributions and pumping rates to meet given management objectives for a hypothetical transient problem for a steady-state field problem. LINEAR MODELS FOR GROUNDWATER MANAGEMENT,
Water Planning for Israel Ltd., Tel-Aviv.
J. Schwarz.
Journal of Hydrology, Vol. 28, No. 2/4, p 377-392, February 1976. 3 fig, 9 ref.

Descriptors: *Groundwater, *Management, *Water resources, *Linear programming, Economics, Aquifers, Storage, Hydraulics, Planning, Optimization, Constraints, Surface waters, Conjunctive use, Pumping, Mathematical models, Equations, Systems analysis.
Identifiers: *Influence model, *Transformation model, Superposition principle, Cost minimization, Benefit maximization.

Managing groundwater aquifers as storage systems may be formulated as a linear programming problem. In most cases, groundwater systems may be considered as linear systems. Standard and extended linear programming routines enable planning and management of complex systems, i.e., alternative users and sources, limited budgets, staged projects, and stochastic inputs. Described are the two different applications of linear programming to the management of groundwater: the one based upon influence equations and the one based on transformation equations. In conclusion, the transformation model is preferable for a small number of cells with time variations of the objective function or with ran-

dom variables such as natural replenishment. The influence model is less restricted by the number of cells but is less adaptable to time varying conditions. The transformation model is especially suited for evaluating operational rules of a conjunctive supply system with different sources and users. (Bell-Cornell)

A SUBURBAN MODEL OF RATIONAL GROUND WATER UTILIZATION: A PLAN FOR NASSAU COUNTY,
City Univ. of New York.
R. White.
In: Proceedings of the International Conference on Water Law and Administration, International Association for Water Law, Feb. 8-14, 1976, Caracas, Venezuela; Published by the Commission for the National Water Resources Development Plan (Coplanarh), Caracas, Venezuela, p 310-330, 1976. 21 p, 2 fig, 20 ref.

Descriptors: *New York, *Water reuse, *Groundwater potential, *Groundwater mining, *Water yield, Water supply, Water table, Aquifers, Water policy, Water resources, Water balance, Aquifer systems, Aquifer management, Groundwater availability, Local governments, Water quality control.
Identifiers: *Nassau County.

Nassau County, located adjacent to New York City on Long Island, obtains all of its water supply from groundwater sources. There is, however, no regional or sub-regional plan for the utilization and protection of these resources. At the present time, they are being slowly exhausted. This paper proposes the implementation of a rational groundwater utilization plan. The general concept of recharging the ground water tables with treated waste water is a logical addition to the use of ground water replenishment reservoirs. Complete sewering should be implemented and unused cesspools drained. Cost, of course, is a factor. Present mining of the ground water reservoir should be recognized as temporary, since the water table level has been noticeably lowered in the past 15 years. This mining has also brought about the problem of saltwater intrusion. The two most hoped-for solutions are: (1) for Nassau County to renovate and recycle an amount of water equivalent to withdrawal in excess of permissive sustained yield; and (2) for Nassau County to work with Suffolk County, which has a water excess, for the establishment of a regional groundwater plan. (Frank-Florida)

GROUND-WATER DATA FOR THE SANTA MARIA VALLEY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
J. L. Hughes, and J. R. Freckleton.
Open-file report, May 1976. 444 p, 12 fig, 5 tab.

Descriptors: *Groundwater, *Basic data collections, *Water wells, *Water levels, *Water quality, Chemical analysis, Pumping, Drawdown, Water yield, Specific capacity, Water level fluctuations.
Identifiers: *Santa Maria Valley(Calif), *Well hydraulics.

In 1968 the U. S. Geological Survey began organizing in computer format ground-water data in the Santa Maria Valley, Calif., in cooperation with the California Water Resources Control Board, Central Coast Region, and the Santa Barbara County Water Agency. The valley covers an area of about 260 sq mi and includes the towns of Santa Maria, Orcutt, and Guadalupe. The principal industries are agriculture, oil production, and sugar-beet refinement. This compilation makes available well records, ground-water-quality data, water levels, and well-hydraulics data, which will be useful in future water-resources planning. (Woodard-USGS)

STATISTICAL ANALYSIS OF WATER-LEVEL SPRINGFLOW, AND STREAMFLOW DATA FOR THE EDWARDS AQUIFER IN SOUTH-CENTRAL TEXAS,
Geological Survey, Austin, Tex.
C. Puente.
Edwards Underground Water District Report, July 1976. 58 p, 19 fig, 4 tab, 10 ref.

Descriptors: *Statistical methods, *Water levels, *Aquifers, *Springs, *Streamflow, Forecasting, Flow rates, Equations, Regression analysis, Hydrology, Groundwater movement.
Identifiers: *Edwards aquifer(Tex).

Water-level, springflow, and streamflow d
were used to develop simple and multiple line
regression equations for use in estimating wa
levels in wells and the flow of three major spri
in the Edwards aquifer in the eastern San Anto
Texas, area. The equations provide da
monthly, and annual estimates that compare v
favorably with observed data. Analyses of geol
ic and hydrologic data indicate that the wa
discharged by the major springs is supp
primarily by regional underflow from the west
southwest and by local recharge in the infiltrat
area in northern Bexar, Comal, and Hays Co
ties. Underflow from the artesian aquifer wes
San Marcos Springs may account for 97 percen
the springflow during periods of extreme drou
(1947 to 1956) and only 46 percent during
periods (1973). On a monthly basis, the underf
component ranges from 40 to 100 percent of
total springflow. From January 1950 to Decem
1974, the underflow components accounted
about 60 percent of the total discharge of San M
cos Springs. A hydrograph shows monthly aver
discharge of the Blanco River at Wimberly, Te
from 1934 to 1973. This stream is representativ
the streams draining the Edwards Plateau in
study. (Woodard-USGS)

system, Geothermal wells, Thermal water che
try.

The thermal water reservoir system which
developed by boreholes in recent years ar
Tiszakecske and Lakitelek was subjected t
tense investigation. The study confirmed and
tended the knowledge of the geothermal anor
revealed previously in Part I of this report (Al
and Galfi, 1966). The development of this w
water geothermal field was carried out through
exploratory and extension wells. Their de
ranged from 250 to 2048 m and penetrated a
mentary sequence of Quaternary-Pliocene
Miocene age. The areal extent of the study
was approximately 150 sq km. Two thermal w
reservoir systems could be distinguished: an u
formation consisting of sand and gravel of Qu
nary age, and a deeper formation including a
series of Pliocene age. In analyzing the n
reservoir parameters and pressure-volume-
perature relations and considering the geolo
conditions, a communication between the
reservoir systems was supposed. The local,
surface geothermal anomaly was due to ascend
relatively warm water from the deeper the
water layer under special geological, hydrodyn
ic, and thermodynamic conditions. By

son, in the southern part of the study area, a
ıtive geothermal anomaly was found to be in-
nced by the descending cold water of meteoric
in. (Roberts-ISWS)

SETTLEMENTS IN THE RAJASTHAN CANAL IRRIGATION AREA, INDIA,
B. D. Bhattacharya.
Ekistics, Vol. 41, No. 242, p. 46-49, January, 1976. 5 fig, 2 tab.

Descriptors: *Human population, *Irrigation canals, *Relocation, *Deserts, Comprehensive planning, Rural areas, Area redevelopment, Social aspects, Asia, Irrigated land.
Identifiers: *India, *Rajasthan.

Relocation and settlement of from 2 to 2.5 million people in an irrigated area of desert land in India near the border with Pakistan is discussed. Mean average rainfall varies from 150 mm to 400 mm and water is the major limiting factor to development of the area. The Rajasthan Canal will bring water to irrigate about 2 million hectares of desert land, thus far the canal network has reached halfway. 400,000 hectares of land have been permanently alloted to cultivators, enabling 80,000 families to settle. Article discusses the basic plan for the layout of villages, market towns, crop production and transportation network. Population in the area has doubled from 200,000 in 1961 when the first water was released to 400,000 in 1975. (Jamail-Arizona)

ESTIMATED GROUNDWATER YIELD FOLLOWING STRIP CUTTING IN PINE PLANTATIONS,
Forest Service (USDA), Cadillac, Mich. North Central Forest Experiment Station.
D. H. Urie.
Water Resources Research, Vol. 7, No. 6, December 1971, p. 1497-1510. 11 fig, 2 tab, 15 ref.

Descriptors: *Groundwater, Streamflow, Vegetation, *Base flow, Pine trees, Water yield, *Jack Pine Trees.
Identifiers: *Strip cutting.

Groundwater recharge balances were determined under 40-acre of blocks of a jack pine (Pinus banksiana Lamb) plantation in northwestern lower Michigan during the 4 years following te removal of 50% of the trees in clear-cut strips. Analyses were made by graphical interpretation of diurnal fluctuations and by use of finite difference equations. In the numerical method, weekly water table elevation measurements over each 40-acre block were used to determine water table convexity, which was then linearly related to the groundwater inflow-outflow balance. Results from both methods of analysis showed the effect of strip cutting as increased groundwater yields. Estimates of water yield by the two methods differed primarily as a result of poor estimates of net evaporative loss from the saturated zone using the graphical method. Three other tests of cutting effects on groundwater recharge supported the budget estimates of treatment effect. Approximately 3 inches per year of additional water was produced as a result of the strip cut during the first 4 years after cutting. The numerical analysis showed that the amount of treatment effect decreased rapidly over this period. (Forest Service)

NATURAL FILTERING OF SUSPENDED SOIL BY A STREAM AT LOW FLOW,
Forest Service (USDA), Corvallis, Oreg. Pacific Northwest Forest and Range Experiment Station.
N. H. Miner.
Research Note, PNW-88, September 1968, 4 p, 1 fig, 2 ref.

Descriptors: *Filtration, *Suspended solids, *Sediments, Low flow, Soil erosion, Streamflow, Road construction, *Soil management.

During road construction soil that is added to a stream by tractors crossing during low flow is temporarily 'filtered' out before it travels far. Five-gallon samples were taken at 150, 300, 600, 1,200 feet downstream from a road crossing, with sodium fluorescein dye used as a tracer. Suspended particle concentration was reduced from 1,055 p.p.m. at 150 feet below the road to 108 p.p.m. at 1,200 feet. The 'filtering' action is a combination of settling larger particles and dilution of sediment-laden water. This filtration is temporary and deposited soil will tend to be flushed downstream during high flows and may cause channel erosion or other damage. (Forest Service)

TIMBER AND WATER,
C. L. Wicht.
South African Forestry Journal, 85, p 3-11, (June 1974). 4 fig, 44 ref.

Descriptors: Drainage basins, *Forest management, Wildlife management, Ecology, Transpiration, *Lumbering, Water yield, *Watershed management, Watersheds(Basins).
Identifiers: South Africa, Drakensberg, Jonkershoek.

A discussion is presented of the management measures that can be applied in mountain catchments if timber and/or water production are the objectives of the management concerned. Catchments are managed by applying knowledge of ecology, engineering and concomitant branches of science, in silvicultural practice, pasture management, wildlife conservation and outdoor recreation. The catchments considered are typical of those found in humid, cool-temperate and warm-temperate forest regions. Also discussed are timber production from the catchments, water yield from the catchments and coordination of results from the catchment experiments. (South Africa)

Identifiers: *South Africa.

The author contends that the vegetation cover of a catchment is a significant factor determining the behaviour of the catchment and that it influences the total water yield of the catchment, the flood and drought flows associated with water yields, the risk of erosion and the quality of the water. He takes a look at the effects of plant cover on stream-flow, at the management of catchment vegetation and reservoir behaviour and catchment management policies and water supply demand. He comes to the conclusion that the significance of the effects of treatment of the vegetation of mountain catchments either by replacing it with plantations or by prescribed burning can be assessed in relation to both the patterns of the water supply demand and the provision of storage to regulate streamflow. ALLOCATION OF WATER TO FORESTRY AND OTHER USERS IN THE CATCHMENT OF THE EERSTE RIVER,
Jonkershoek Forest Research Station, Stellenbosch (South Africa).
D. W. Van Der Zel, and C. L. Wicht.
Forestry in South Africa, No. 15, p. 47-55, July 1974.

Descriptors: *Burning, Rainfall-runoff relationships, *Evapotranspiration, River basins, Irrigation, *Watershed management, Water allocation(Policy), *Water distribution(Applied), Systems analysis, Forest management.
Identifiers: *South Africa, *Eerste River, *Fynbos.

A system analysis of the water component within the Eerste River catchment in the Stellenbosch District, Cape Province South Africa, is presented. Input of water from rain, and output through vapour losses and discharge to the sea, are compared. One third of the output is attributed to vapour losses from fynbos and about the same from irrigation, while one fifth flows to the sea. Much water could be saved by treatment of the fynbos (controlled burning) and by improved irrigation. Expansion of research into restriction of vapour losses is recommended. (South Africa)

Identifiers: *South Africa, Klein Drakenstein Mountains.

In this first paper in a series on research, five Zachariashoek research catchments, situated in the Klein Drakenstein Mountains of the south-western Cape, are described. Preliminary rainfall figures are included and the topography, geology, vegetation and hydrography are explained. Treatments consist of periodic burning of catchment areas of about 250 ha each on rotations of four and 12 years. Water quantity, regime and quality are regularly measured. Vegetation composition is regularly observed on 50 m2 quadrats and phytomass yields are estimated. Research results should be applicable to a considerable area of mountain catchments in the south-western Cape. (South Africa)

INSTALLATIONS FOR MONITORING OIL CONTENT,
Bailey Meters and Controls Ltd., Croydon (England). (Assignee).
R. M. deVial.
U. S. Patent No 3,965,920, 9 p, 4 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2025, June 29, 1976.

Descriptors: *Patents, *Monitoring, *Control systems, *Oil pollution, *Oily water, *Pollutant identification, Water pollution, Control systems, Ultraviolet radiation, Equipment.
Identifiers: Ballast water, Tankers, Photo-electric cells.

Installations for monitoring oil content in a stream of water, and more particularly, in a discharge of water ballast from cargo tanks of an oil tanker are described. The installation for monitoring the oil content in a stream of water includes a sampling connection connected to receive a flow of water, an emulsifier connected to receive a fraction of the flow of water from the sampline connection and discharge the fraction, after thorough mixing, to a number of downward discharging orifices having co-planer axes of discharge in a sampling chamber. A beam of ultraviolet radiation of wavelength in the range 200 to 400 n.m. is arranged to be incident upon jets discharged from the orifices. A photoelectric cell receives fluorescent radiation emitted from the jets at wavelengths greater than 400 n.m. An alarm circuit arranged upon the photo-electric cell receiving radiation greater than a predetermined value energises a pneumatically operated alarm system by benting a pneumatic pilot pressure line. (Sinha-OEIS)

OIL-IN-WATER MONITOR,
M. G. Grant.
U.S. Patent No. 3,966,603, 6 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2246, June 29, 1976.

Descriptors: *Patents, *Monitoring, *Oil pollution, *Oily water, *Water pollution sources, *Pollutant identification, Sensors, Equipment, Effluent streams.
Identifiers: Bilge water.

A system for monitoring oil in water which is being transferred from a first to a second location is described. Monitors are needed to ascertain that the separator is performing its function properly, and that the oil in the effluent bilge water is less than a predetermined amount. A pressure vessel coalesces oil from the effluent and gathers the oil in a collection section which is automatically emptied after an hour. If more than a predetermined amount of oil is gathered in the hour, an oil-sensing probe sends a signal to activate a warning light valve which permit pipes to return the effluent to the separator. If the effluent becomes too turbid, a turbidity senser activates an alarm and the valves which permit pipes to return the effluent to the separator. If the coalescer unit clogs, an indication is given by a differential pressure gauge. (Sinha-OEIS)

MODIFIED BIOASSAY PROCEDURE FOR TOXIC EFFLUENTS,
Jyvaskyla Univ. (Finland). Dept. of Biology.
V. Eloranta.
Journal of Water Pollution Control Federation, Vol. 47, No. 8, p. 2172-2177, August 1975. 4 fig., 12 ref.

Descriptors: *Methodology, *Analytical techniques, *Bioassay, *Algae, Laboratory tests, *Toxicity, *Sulfur compounds, *Sulfite liquors, *Industrial wastes, Photosynthesis, Spectrophotometry, Growth rates, Mortality, Water pollution effects, Effluents, Liquid wastes, *Pollutant identification, *Bioindicators.
Identifiers: *Ankistrodesmus sp., Sulfite-lye.

The alga, Ankistrodesmus falcatus var. acicularis was used in a bioassay experiment to determine the toxicity of sulfite-lye at four dilutions. Effluents were added to the cultures when logarithmic growth had been reached after 5 to 7 days. During the light period a mixture of air and 6 percent CO2 was fed into the flasks to maintain a neutral pH. The growth of algae was followed by measuring the chlorophyll a content of the cultures daily. The sulfite lye was found to kill the algae or inhibit their growth at all concentrations used. (Katz)

AROMATIC HYDROCARBONS IN AQUATIC FAUNA,
Atlantic Biological Station, St. Andrews (New Brunswick).
V. Zitko.
Bulletin of Environmental Contamination and Toxicology, Vol. 14, No. 5, p. 621-631, 1975. 2 tab., 4 fig., 12 ref.

Descriptors: *Analytical techniques, *Fluorometry, *Pollutant identification, *Chemical analysis, Creosote, Oil, *Oil pollution, *Aromatic compounds, *Shellfish, Aquatic animals, *Testing procedures, Organic compounds, Oil wastes, Oil spills, Water pollution sources, Methodology, Monitoring.

A rapid method for screening of aquatic fauna for the presence of polynuclear aromatic hydrocarbons is described. The mixture of hydrocarbons is separated from lipids by column chromatography on alumina, characterized and quantitated by fluorometry with pyrene as a fluorescence standard. The method can be used to detect contamination of aquatic fauna by crude oil, fuel oils, and creosote oil. The detection of crude, Bunker C, and creosote oil in the described method is approximately 100, 50, and 100 microgram/gram lipid, respectively. Polynuclear aromatic hydrocarbons of these oils were not detectable in samples of fish and seals. Creosote oil in concentrations ranging from 202 to 3254 micrograms/gram lipid was detected in the samples of shellfish. (Katz)

OPTIMUM ALLOCATION STRATEGIES FOR SAMPLING BENTHOS IN THE NEW YORK BIGHT,
Rhode Island Univ., Kingston. Marine Experiment Station.
S. B. Saila, R. A. Pikanowski, and D. S. Vaughan.
Estuarine and Coastal Marine Science, Vol. 4, No. 2, p. 119-128, 1976. 1 fig., 2 tab., 5 ref.

Descriptors: *Sampling, *Methodology, *Analytical techniques, *Optimization, Assay, *Testing procedures, Project planning, Trace elements, Invertebrates, Mathematical studies, *Benthos, *Bioassay, Pollutant identification.
Identifiers: *Marine ecosystems analysis, *New York Bight, Cerianthus americanus.

Sampling plans based on historical data available from the Marine Ecosystems Analysis (Mesa) New York Bight Project are described and illustrated. These plans provide the requisite levels of precision for the minimum expenditure of time and effort. Sampling for a single variable such as selected trace elements is optimized directly. Sampling for several variables simultaneously in a two-stage scheme can also be optimized. The optimization procedure is explained and illustrated in detail and results for a realistic case are given. Relatively few replicates (approximately five) are shown to be required to test reasonably defined hypotheses concerning differences in trace elements between two stations. Sample sizes for seven species were determined and a compromising allocation is discussed. (Katz)

Astarte, Vol. 7, no. 2, p. 71-76, 1974. 1 fig., 6 tab., 21 ref.

Descriptors: *Mercury, *Bird eggs, *Gulls, *Heavy metals, *Path of pollutants analytical techniques, Metals, Reproduction, Food chains, Food webs, Gas chromatography, Hatching.
Identifiers: *Larus spp., *Norway, Uria spp., Alca spp. Rissa spp., Sula spp. Guillemot, Razorbill, *Seabird eggs.

Seabird eggs from nine locations along the coast of Norway were sampled for mercury content. Mercury levels in Herring Gull eggs from sites below 59 degrees north latitude, averaged 0.34 ppm. From northern localities eggs of Herring Gull (Larus argentatus), Guillemot (Uria aalge), and razorbill (Alca torda) contained less than 0.10 ppm, eggs of Kittiwake (Rissa tridactyla) less than 0.15 ppm, and the Gannet (Sula bassana) 0.58 ppm, all average values. More than 90 per cent of the mercury was in methyl form. (Katz)

MOLECULAR FORMS OF ARSENIC IN THE ENVIRONMENT,
University of South Florida, Tampa. Dept. of Chemistry.
R. S. Braman.
In: International Joint Commission's Workshop Proceedings 'Toxicity to Biota of Metal Forms in Natural Water', October 7-8, 1975, Duluth, Minn. p. 249-261. April 1976. 3 fig., 4 tab., 7 ref. NSF (RALNN) GI-43753 and AEN 75-14278.

Descriptors: *Arsenic compounds, *Analytical techniques, *Pollutant identification, Freshwater, Sea water, Sodium arsenite, Reduction(Chemical), Air environment.
Identifiers: Inorganic arsenic(III), Methylarsenic acid, Dimethylarsenic acid, Trimethylarsine oxides.

Described is an analytical technique which can determine down to approximately 0.02 ppb or 1 ng ambient concentrations of inorganic arsenic (III), arsenic (V), methylarsenic acid, dimethylarsenic acid, and trimethylarsine odide type compounds in freshwater, seawater, and air. Based upon observation of arsenic atomic emission lines in a d.c. dicharge, the method also involves the separation of arsine and methyl arsines after reduction of corresponding arsenic compounds by sodium borohydride. Acidity of the reduction conditions is important and is used to differentiate between arsenic (III) and (V). The various arsenic acids must also be completely protonated before they can be reduced to the corresponding arsines. Arsenic appears to be higher in lakes or ponds surrounded by fertilized lawns and which have no inflows or outflows. The concentration of methylarsenic compounds increases with the increase in arsenic concentration. Methylarsenic compounds were found in nearshore seawater areas and in association with the sargassum weed in the open oceans; shrimp, barnacles and fish in the sargassum weed ecosystem also showed small amounts of methylarsenic compounds. Air transport is a definite contamination source . Indoor areas, such as greenhouses, exhibited a marked evidence of alkylarsenic compounds in the air. (See also W77-01295) (Auen-Wisconsin)

P. H. Davies.
In: International Joint Commission's Worksho
Proceedings 'Toxicity to Biota of Metal Forms i
Natural Water', October 7-8, 1975, Duluth, Minn
p. 93-126, April 1976. 4 fig., 14 tab., 16 ref.

Descriptors: *Heavy metals, *Toxicity *Measurement, *Analytical techniques *Standards, Solubility, Dialysis, Rainbow trou Lead, Alkalinity, Hardness(Water), Lethal limi Chemical precipitation, Cadmium, Polarographi analysis, Spectrophotometry, Silver iodide, Chel tion.
Identifiers: *Application factor.

The toxicity of a particular metal can be dete mined irrespective of water quality when properl analyzed. This has been verified by long-term to icity tests with lead and rainbow trout in hard an soft waters using atomic absorption for total le and pulse polarographic analyses for dissolve lead. The experiments delineate the chemistry lead, its toxicity to trout, and also demonstrate t failure of the application factor approach to pr dict safe heavy metal concentration in differe types of water when chemical analyses are bas on total concentrations of metals. When based analyses of dissolved metals the utility of the a plication factor concept is verified. Its greate potential use may be in predicting safe concentr tions where synergistic and/or antagonist mechanisms exist. The use of dialysis tubing differentiate between dissolved and complex forms of heavy metals is evaluated in investig tions of cadmium toxicity to rainbow trout in ha and soft waters. The effects of filtration analytical results, as a means for identifyi 'dissolved' metal fractions is also discussed. method demonstrates a long-term testi procedure of the 'insoluble compounds' with limits of their solubility constants by measur the toxicity of silver iodide to rainbow trout in so waters. R. A. Kimerle, R. D. Swisher, and R. M. Schroeder-Comotto.
In: International Joint Commission Symposium 'Structure-Activity Correlations in Studies of To icity and Bioconcentration with Aquatic Org isms,' March 11-13, 1975, Canada Center for land Waters, Burlington, Ontario, p 25-55. 7 fig tab, 12 ref.

Descriptors: *Surfactants, *Toxicity, *Chemica *Molecular structure, *Solubility, Linear alkyl sulfonates, Lethal limit, Sorption, Daphnia, M nows, Food chains, Osmosis, Pollutant identifi tion.
Identifiers: Bioconcentration, Partition coef cient.

An attempt is described to determine the fact influencing measurement of the octanol/water p tition coefficients of surfactants, and the relati ship of surfactant partition coefficient to bioac mulation and acute toxicity. The surfactants s died were series of LAS individual homologs w

chain lengths from 9 to 15 carbon atoms, sentative commercial LAS blends, and a car- lated LAS simulating a degradation polite. The partition coefficient for a given sample may vary up to an order of magnitude ore, depending on LAS (1/c) concentration, nt ratio, and water hardness. Correlation of artition coefficient data with each of the oing toxicological properties indicated that LAS surfactants do behave in a more or less ar manner on Daphnia magna. It was not ble to correlate the partition coefficients with ncentration factors of specific organs and tis- of fathead minnows because LAS was readily olized and eliminated from the body. The metabolite, sulfophylundecanoic acid dis- salt, showed a markedly lower partition cient and acute toxicity. The results suggest n limitations in the applicability of partition cients to prediction of bioaccumulation. ugh the partition coefficient measured for riginal compound may govern its input rate he organism, the clearance of metabolites epend on their own partition coefficients, may greatly differ. TOXICITY INDEX FOR PERMITS,
National Field Investigations Center-Denver, Colo.
D. B. Seba.
In: International Joint Commission Symposium on 'Structure-Activity Correlations in Studies of Toxicity and Bioconcentration with Aquatic Organisms,' March 11-13, 1975, Canada Center for Inland Waters, Burlington, Ontario, p. 199-259. 7 fig., 2 tab., 148 ref.

Descriptors: *Toxicity, *Monitoring, *Standards, *Permits, Organic compounds, Molecular structure, Lethal limit, Water pollution control, Chemical properties, Effluents, Chemicals.
Identifiers: *Toxic units.

Water pollution control by the concept of 'toxic units' to be incorporated in an effluent permit system is considered. Because small differences in chemical structure can significantly influence the biologic effects of chemicals it is difficult to accurately forecast the toxicity of compounds to aquatic organisms by extrapolation from exposure data tests on alternative chemicals, it is proposed that a coefficient of relative potency can be derived to substantiate the toxic units concept. This approach to the problem of experimental prediction of adverse effects by the use of a reference substance for which toxicity is known for a particular structure is of possible use. Specific calculations, based on tolerance level median data, are presented for nitro, amine, nitrile, amide compounds, hetercycles, and phenols. A standard is proposed of 0.05 TU (toxic units) based on the tolerance level median 96-hr value or 96-hr exposure survival, and equations on how to measure that standard are shown. While the toxic units measurement contains assumptions and limitations thus its usage is not the ultimate monitoring device, it does place the burden on the discharger to maintain environmental quality control. THE DETERMINATION OF CALCIUM- IN SEA WATER, CORALS AND CALCAREOUS ALGAE BY LIQUID SCINTILLATION COUNTING,
Cape Town Univ. (South Africa). Dept. of Biochemistry.
E. L. Bohm, and T. F. Goreau.
Trans. Roy. Soc. So. Afr., Vol 41 (1), p 25-31, (1974). 4 fig, 3 tab, 15 ref.

Descriptors: *Water analysis, *Sea water, *coral, Marine algae, Nitrates, Hydrogen bonding, Performance, *Pollutant identification, Calcium, Plant tissues.
Identifiers: Instagel, ETCS dioxane, *Liquid scintillation counting, South Africa, *Calcium-45, *Calcereous algae.

Calcium isolated from various fractions of corals and algae is converted into nitrate and dissolved in a water-ethyleneglycolmonoethylether-dioxane cocktail in the ratio of 1:2:20 using PPO and 1-dimethyl-POPOP as scintillators. 45Ca in sea water is counted directly after dilution of 1:10 with water. The carrier capacity of the system is 3 mmole Ca (NO3)2/23 ml (120 mg Ca). The counting efficiencies at minimum and maximum carrier concentration are 88,7% and 78,5% respectively. The scintillator solvent system is chemically stable and counts are highly reproducible. Instagel in the ratio of 10 ml to 1 ml aqueous solution gives counting efficiencies in the region of 80%. Sea water can be incorporated directly. Algal calcium is counted as the nitrate or the chloride. The carrier capacity of Instagel is higher and the counting efficiency is less affected by large concentrations of carrier and excess acid. (South Africa)

ENERGY DISPERSIVE X-RAY ANALYSIS (EDAX) AS AN AUTOPSY TECHNIQUE FOR COPPER-CAUSED FISH MORTALITY,
National Inst. for Water Research, Pretoria (South Africa).
Deryl J. Barlow, and W. S. G. Morgan.
Water S A, Vol 1 (3), p 109-112 (1975). 3 fig, 1 tab, 12 ref.

Descriptors: *X-Ray analysis, *Fishkill, Metals, Toxicity, Copper, Electron microscopy, Lethal limit, *Pollutant identification, *Mortality, Absorption.
Identifiers: South Africa, Fish tissue analysis.

Energy dispersive analysis of X-rays (EDAS) can be used to indicate acute copper toxicity in fish. Copper was absorbed from lethal concentrations of copper sulphate by gill and liver tissue. Small quantities of copper were also found in opercular bones. Furthermore, as a cause of mortality, copper could be detected up to 48 hours after death. It is probable that the technique is not specific for copper toxicity but may be used as a rapid means of detecting a number of metal ion toxicants in dead fish. (South Africa)

Identifiers: South Africa, Hartbeespoort Dam, Jukskei River, Crocodile River, Transvaal.

Analyses of the sediment fraction <2 microns has been shown to be a reliable indicator of heavy metal pollution in the water environment. Based on this premise, research has been conducted to establish the presence of heavy metals in the sediments of the Hartbeespoort Dam near Pretoria which receives purified domestic and industrial effluents via the Jukskei and Crocodile Rivers. It was found that heavy metal enrichment in the Hartbeespoort Dam sediments could be divided into two groups: Enrichment of the western zone of the dam with iron, chromium, cobalt and nickel which could be ascribed to the basic geological formations associated with the feeder streams discharging into this section of the dam; and enrichment of the south-eastern zone of the dam with zinc, lead, mercury and cadmium which could be ascribed to pollution from domestic and industrial sources entering the dam via the Crocodile River. It is shown how it is possible to distinguish between heavy metal enrichment of sediments derived from geological sources and from man-made pollution respectively. (South Africa)

EP WELL WASTES MAY BE WATER ZARDS.
ence News, Vol 109, p 295, May 8, 1976. 1 p.

scriptors: *Chemical wastes, *Underground ste disposal, *Injection wells, *Groundwater ources, *Underground storage, Water supply, page, Sewage disposal, Sewage treatment, lls, Underground streams, Aquifers, Subsur- e waters, Chemicals, Injection, Water ources.

e common notion that well injection liquids ain stable has come under attack from a recent dy done on wells in North Carolina. Whereas companies have been pumping brine into un- ground formations to force the oil to the sur- e without ill effects, there seem to be dangers olved in the injection of chemical wastes, and ecially of acetic wastes. Scientists found from ervation of 14 wells that the acids were quite table, that they caused clay minerals and iron des to dissolve from the acquifers and move ough underground formations, and that they sed re-precipitation forming a gel-like material ich plugged the pores of the acquifer. The team ng the study recommended that initial testing done on the chemicals before injection. thermore, where necessary, there should be treatment so that groundwater movement uld not pollute drinking water supplies. SLIME AND THE RIVER,
Graham.
dobon, Vol 77, p 9-15, March 1975. 7 p, 1 map, noto.

Descriptors: *Federal Water Pollution Control Act, Rivers, *River regulation, *Pulp wastes, *Pulp and paper industry, Water pollution, Industrial wastes, Wastes, Water pollution sources, Chemical wastes, Lumbering, Wood wastes, Forests, Bleaching wastes, Legal aspects, Water pollution treatment, Maine, New Hampshire.
Identifiers: *FWPCA Amendments of 1972, *Androscoggin River(NH-ME).

The Androscoggin River flows south through New Hampshire into Maine. The river begins in a sparkling pure condition at Umbagog Lake and flows some 90 miles before it runs by paper and pulp mills. Berlin, New Hampshire, is the site of a pulp mill that puts 3,500 gallons of waste sulfite liquor into the water for each ton of pulp produced. Berlin is also the site of 45 public sewers discharging untreated wastes into the Androscoggin while another twenty empty into a tributary, the Dead River. The river's future rests in part with how well the Federal Water Pollution Control Act amendments of 1972 withstand the current environmental slowdown. An extension has just been granted to the Brown Company Pulp Mill of Berlin that will permit unimpeded pollution for at least another year. Pollution treatment planta are presently being built by industry and town alike; however, it maybe 'too little, too late'. It is hoped that the possible inclusion of large stretches of the river under the protection of the National Wild and Scenic Rivers System might bring substantial improvement. (Frank-Florida)

TOTAL MINERAL DISSOLVED TRANSPORT BY WORLD MAJOR RIVERS,
Paris Univ., Orsay (France). Ecol Normale Superieure; and Paris Univ. (France). Laboratoire de Geologie.
M. Meybeck.
Hydrological Sciences Bulletin, Vol. 21, No. 2, p 265-284, June 1976. 3 fig, 3 tab, 77 ref.

Descriptors: *Rivers, *Ion transport, Mineral water, Hydrology, Water quality, Discharge, Runoff, Oceans, Equations, Topography, Climates, Path of pollutants.
Identifiers: *Mineral transport, *Dissolved transport, Ion content, Specific discharge, Solid transport data, Water mineralization, Ionic ratios, Hydrologic features, Water quality data.

World variations of dissolved transport (Td) and major ion content with runoff and solid transport (Ts) were examined on the basis of 40 of the world's biggest rivers. For each river, estimates of each of the above factors were given, and two subsamples were considered according to the size of the rivers. For each subsample it was found that major ion content was inversely related to runoff, and dissolved transport was directly related to runoff and to solid transport. The ratio Ts/Td was highly variable, but it generally increased when solid transport increased. Climate dominated major ion content variation, and relief dominated dissolved transport variation. Wide scatterings of major ion content and dissolved transport were due to the other factor - relief or climate respectively. On a world scale, relief was the main factor controlling variations of dissolved transport with solid transport. The direct relationship between dissolved transport and solid transport confirmed the work of Alekin and Brazhnikova in the USSR, while the inverse relationship found by Judson and Ritter in the conterminous United States seemed to be a minor trend due to the influence of climate surpassing relief. It was concluded that if chemical transport is a major factor on the earth's surface, the solid material carried by the rivers to the ocean as a whole is five times more than the dissolved transport on the basis of these 40 rivers. MODELING OF UNSTEADY TEMPERATURE DISTRIBUTION IN RIVERS WITH THERMAL DISCHARGES,
Purdue Univ. Lafayette, Ind. School of Mechanical Engineering. and Purdue Univ., Lafayette, Ind. Heat Transfer Lab.
R. G. Hills, and R. Viskanta.
Water Resources Research, Vol. 12, No. 4, p 712-722, August 1976. 20 fig, 29 ref.

Descriptors: *Heated water, *Thermal stratification, Analytical techniques, *Turbulent flow, *Mixing, Water temperature, Channel flow, Heat transfer, Radiation, Numerical analysis, Equations, Rivers, *Thermal pollution.
Identifiers: *Unsteady temperature distribution, Temperature distribution, Thermal discharge.

Unsteady temperature distribution was analyzed in a wide channel simulating a river. The effects of thermal discharges, meteorological conditions, solar and atmospheric radiation, and channel parameters on the thermal structure of a river were analyzed and discussed by utilizing an analytical model for the unsteady three-dimensional temperature distribution in the far field of a thermally stratified channel. The conservation of energy equation for turbulent flow was solved numerically with an alternating direction implicit finite difference scheme. The effects of thermal start-up, discharge temperature level, discharge location, river flow velocity, and other factors were investigated. The results showed that the greater the temperature excess above the ambient at the discharge, the greater downstream distance is needed to reach a fully mixed condition because of the suppressive effect of stratification on the turbulent mixing. The greater surface temperatures associated with thermally stratified flow resulted in increased heat dissipation and water evaporation from the surface. (Singh-ISWS)

NITRATE AND CHLORIDE POLLUTION OF AQUIFERS: A REGIONAL STUDY WITH THE AID OF A SINGLE-CELL MODEL,
Tahal-Water Planning for Israel, Ltd. Tel-Aviv.
A. Mercado.
Water Resources Research, Vol. 12, No. 4, p 731-747, August 1976. 15 fig, 6 tab, 7 ref.

Descriptors: *Nitrates, *Chlorides, *Water pollution, *Aquifers, *Mathematical models, Water pollution sources, Hydrologic properties, Zone of aeration, Water wells, Water table, Biochemistry, Groundwater, Tracers, Forecasting, Monte Carlo method, Probability, Statistical models, Tertiary treatment, Groundwater recharge, Equations.
Identifiers: *Israel, Single-cell model.

A single-cell model was used to study the regional chloride and nitrate pollution patterns in part of the coastal aquifer of Israel. The model integrated pollution sources on the land surface, hydrologic parameters of the aquifer and the unsaturated zone, and variations of chloride and nitrate concentration distribution in pumping wells. Complicated hydrologic and biochemical processes in the unsaturated zone were simplified and represented by two basic parameters: (1) transit time from land surface to the aquifer, and (2) nitrogen losses in the soil. It was shown that linear relationships exist between nitrogen quantities released on the surface and the quantities reaching the water table. The calibration of the model enabled its use for prediction purposes. The Monte Carlo technique was introduced to determine the range of predicted average groundwater concentrations as a function of time. The forecasts

presented call for urgent protection measures in order to meet drinking water standards for maximum nitrate concentrations. Thirteen alternative protection measures were examined and then compared to predictions based on present nitrogen loads and hydrologic regime. The exchange relationships between these measures were derived, and it was suggested that they can be used later for evaluating economic criteria for protecting groundwater quality. (Visocky-ISWS)

NON-POINT SOURCE CONTRIBUTIONS TO WATER QUALITY PROBLEMS,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
E. A. McBean, and J. E. Gorrie.
In: Proceedings of the 10th Canadian Symposium 1975, Water Pollution Research Canada, p 142-150. 12 fig, 9 tab, 6 ref.

Descriptors: *Water pollution control, *Nitrogen, *Phosphorus, *Regression analysis, *Water quality, Drainage area, River basins, Sampling, Flow, Systems analysis, Path of pollutants.
Identifiers: *St. John River basin(New Brunswick, Canada), Mass flux, Instream flow, Multiple regression technique, *Non-point pollution sources.

Non-point source contributions of nitrogen and phosphorus are examined. A useful relation between nitrogen and phosphorus mass flux and instream flow is demonstrated to occur at a number of sampling locations situated on the Saint John River Basin. As well, through a multiple regression study, evidence is presented that argues that the variations in non-point source loadings observed from location to location are explainable in terms of the variations of relatively easily-measured parameters that describe the contributing areas. THE MODELLING AND CONTROL OF POLLUTION IN A RIVER SYSTEM,
Cambridge Univ. (England). Dept. of Engineering.
P. Young, B. Beck, and M. Singh.
Journal of Hydrology, Vol. 28, No. 2/4, p 289-316, February 1976. (Published in Amsterdam) 7 fig, 24 ref.

Descriptors: *Water pollution control, *Mathematical models, *River systems, *Water quality, Dissolved oxygen, Biochemical oxygen demand, Effluents, Sewage, Design, Simulation analysis, Optimization, Equations, Systems analysis, Path of pollutants.

A river which is being used either as a source for potable supply or for recreation requires an adequate and, if possible, an automatic control system for maintaining pollution levels within reasonable bounds consistent both with the needs of the community and the requirements for maintaining a satisfactory ecological balance. This paper makes a preliminary examination of the design of such a system by considering the dynamic modeling and control of dissolved oxygen (DO) and biochemical oxygen demand (BOD) in a river system. This includes a discussion on the derivation and verification of simple DO-BOD models for a typical river, as well as initial thoughts on the operational control of sewage effluent discharges in order to maintain specified levels of dissolved oxygen in single and multiple reach river systems. SPATIAL DISPERSION OF AN ESTUARINE BENTHIC FAUNAL COMMUNITY,
Swedish Water and Air Pollution Research Lab., Goteborg.
R. Rosenberg.
Journal of Experimental Marine Biology and Ecology, Vol. 15, p. 69-80, 1974. 3 fig., 4 tab., 15 ref.

Descriptors: *Biological communities, *Benthic fauna, *Benthos, *Biomass, *Spatial distribution, Population, Aquatic populations, Methodology, Distribution, Sampling, Bottom sampling, Crustaceans, Sediments, Water pollution effects, Environmental effects, *Estuarine environment.

By means of a box-sampler 20 moderately undisturbed sediment samples were obtained and subsampled. The fauna in the upper 0-5 cm of the sediments was compared to that in the 5-10 cm layer. Almost all species collected in both strata were found in the upper 0-5 cm about 64% of the individuals and 74% of the biomass were restricted to this upper layer. A sample area of 0.5 square meter (depth 0-10 cm) was found to be sufficient to make a quantitative evaluation of the benthic community. The horizontal dispersion of the macrobenthic community was studied using the variance/mean ratio and its dependence on sample size is discussed. The abundant species occurred in patches larger than 0.06 square meter and were correlated with aggregation. (Katz)

ORGANIC MATTER IN ATMOSPHERIC PRECIPITATION IN THE VORONEZH REGION, (IN RUSSIAN),
Voronezhskii Lesotekhnicheskii Institut (USSR).
I. M. Rozinoer, A. P. Saprykina, and S. M. Poroiskaya.
Gidrobiol Zh. 9(2), p 100-104, 1973.

Descriptors: *Rain water, *Organic matt *Measurement, Carbon compounds, Nitrog Snow, Acids, Amino acids microorganisn Precipitation(Atmospheric).
Identifiers: Esters, Fatty acids, Macrophyt USSR, *Voronezh region(USSR).

Organic matter in 10 samples of rain water and of water from snow obtained near the Voron River in Voronezh, USSR, were analyzed in sociation with the filling of the Voronezh Res voir by flood waters. The total content of orga matter determined by permanganate oxidizabil and nonvolatile C compounds was lower summer and spring rain water and higher in sn than in river water during the same period. T amount of N was 2-3 times higher in precipita water; this was evidently due to anthropoge factors. All 3 indices were higher in summer- rain than in snow. Volatile fatty acids occurred all the samples, varying from 4.8-7.4 micro equivalent/l for rain and 1.2-23.8 micro equivalent/l for snow. The higher amount volatile organic acids in river water was m pronounced in summer than in winter. In m samples no free amino acids were found. Increa in the content of amino acids in hydrolysates v linked to the breakdown of protein by microorg isms and macrophytes. Complex esters w found in the majority of rain water samples and almost all the snow samples. Tests made 18 from the city in an attempt to escape the effects pollution gave the same results.--Copyright 19 Biological Abstracts, Inc.

Identifiers: Computer model REDEQL II, Ligands, Thalassiosira pseudonana.

A bioassay technique that measures 0.003 M concentrations of EDTA in metal-ligand interactions, using the growth response of the oceanic diatom Thalassiosira pseudonana in artificial seawater, is described. At the equivalence point (point of maximum inflection of the signoid curve) the moles of copper added are equal to the moles of EDTA present in solution. The T. pseudonana copper bioassay could also be utilized as an endpoint detector for the quantitative measurement of copper binding capacity of seawater, and to quantitate natural organic chelators which might occur by using the methodology described. This bioassay is also applicable to semi-quantitation of the presence of natural or added synthetic chelators in the marine environment. The addition of synthetic chelators to oceanic waters could have three immediate ramifications. First, metals may become solubilized and transported from regions of high concentration to uncontaminated areas. Second, over-chelation of trace metals necessary for the growth of marine organisms, especially phytoplankton, is possible. Third, increased pathogenicity of marine waters could occur by the reduction of the 'natural' metal toxicity of seawater. Another potential predictive tool of metal-ligand interactions in seawater is the chemical computer model REDEQUL II, that includes equilibrium reactions between the major anions and cations in seawater. W. B. Neely.
In: International Joint Commission Symposium on 'Structure-Activity Correlations in Studies of Toxicity and Bioconcentration with Aquatic Organisms,' March 11-13, 1975, Canada Center for Inland Waters, Burlington, Ontario, p. 261-269. 1 fig., 4 ref.

Descriptors: *Mathematical models, *Chemicals, Design, Temporal distribution, Spatial distribution, Toxicity, Pollutant identification, Food chains.
Identifiers: *Bioconcentration.

The chemical industry's use of mathematical models is to help the decision maker to interpret data, guide ongoing data collection efforts, and make predictions on future events. Another function of their models is to approximate an ecosystem so that perturbations by new inputs can be depicted and resulting consequences simulated. The underlying principle of a simulation is the decision as to what questions are asked and what information needs to be generated. Compartment models are generally used by the industry to resolve the problems of predicting the time/space distribution of chemicals and the relations that exist between the ecosystem components. The primary steps in model building consist of : (1) Explanation of bioconcentration, with pollution coefficients following as a natural extension; (2) distribution of a chemical in the ecosystem; and (3) space/time distribution posing the questions of how toxic is the material; what will the concentration profile look like downstream; where the nearest drinking water intake is; and how long the wave reaches that point. This discussion was illustrated by slides. (See also W77-01310) (Auen-Wisconsin)

R. H. Hawkins.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 102, No. EE4, Proceedings Paper 12292, p 737-743, August 1976. 3 fig, 3 tab, 9 ref, append.

Descriptors: *Chlorides, *Deicers, *Urban runoff, *Salts, *New York, Water quality, Low flow, Groundwater, Watersheds(Basins), Water pollution sources.
Identifiers: *Syracuse(NY), *Meadowbrook Watershed(NY).

Street salting studies in the Meadowbrook Watershed, Syracuse, New York were described. Over a 3 yr study period, 81.5% of the salts applied left the watershed in runoff waters. Considering the suburban nature of the basin, this was in consonance with results found elsewhere. Chloride concentrations in the low flow months of April-October were found to increase with time, suggesting that salt is accumulating in the local groundwater, which is a source of supply for these low flows. E. I. Spynu, L. N. Ivanova, and A. V. Bolotnyi.
Gig Sanit. 38(10), p 75-79, 1973.

Descriptors: Pesticides, Environment, Pollutants, *Organic pesticides, *Organophosphorus pesticides, *Reviews, *Water pollution, *Air pollution, *Soil contamination, Path of pollutants.

A review of the literature showed that the behavior of organophosphorus pesticides in the environment depends on many factors. The migration of these pesticides with the soil solution can lead to the formation of a pollution chain: soil-plant and soil-water. Four groups of factors determining the level and persistence of pesticides in individual media and processes of their migration are distinguished: the physicochemical properties of the pesticides, characteristics of the medium (soil, plant, water, air), conditions of applying the pesticides, and climatic and geographic characteristics of individual regions where the pesticides are used.--Copyright 1975, Biological Abstracts, Inc.

CHEMICAL AND PHYSICAL CHARACTERISTICS OF WATER IN ESTUARIES OF TEXAS, OCTOBER 1971-SEPTEMBER 1973,
Geological Survey, Austin, Tex.
K. W. Ratzlaff.
Texas Water Development Board Report 208, June 1976. 348 p, 13 fig, 10 tab, 6 ref.

Descriptors: *Water quality, *Path of pollutants, *Estuaries, *Gulf of Mexico, *Texas, Basic data collections, Water analysis, Chemical analysis, Sampling, Physicochemical properties, Biological properties, Nutrients, Heavy metals, Tidal effects.

This report, fifth in an annual series of basic-d reports, presents data collected during water ye 1972 and 1973 in the estuaries of Texas. The obj tives of the investigation are to define: (1) The currence, source, and distribution of nutrients; the physical, organic, and inorganic water-qual constituents and their areal distribution and ti variations; (3) the chemical and physical char teristics of Gulf water that enters the estuaries; the occurrence, quality, quantity, and dispers of drainage entering the estuarine systems; and the current patterns, directions, and rates of wa movement. Approximately 400 data-collect sites were visited yearly during water years 1 and 1973. (Woodard-USGS)

Descriptors: *Nitrates, *Nitrification, *Nitro fixing bacteria, Streamflow, *Appalachian Mo tain Region, Southeast US, Streams, Nitrog Watersheds(Basins), Path of pollutants.
Identifiers: Southern Appalachians rep Nitrate nitrogen.

The nitrate content of stream water and the nitr ing bacterial population of the terrestrial hori were measured in three southern Appalach watersheds over a 22-month period. watersheds studied were a fescue g catchment, a 15-year old white pine plantati and a mature undisturbed hardwood for Monthly averages of nitrate-nitrogen in stre water from the three watersheds were 730, and 3 ppb respectively, the respective nitrify populations averaged 16,000, 175 and 22 per g of dry weight for each 40 cm soil profile. Th populations were concentrated in the upper 10 of the profile (grass = 98%, white pine = 90%, hardwood = 88%). A correlation is evi between the number of nitrifying bacteria in soil from gaged watersheds and the NO3 con of the streams. Nitrifying activity appears to dependent on vegetation type and successi stage. (Forest Service)

METHANE, CARBON DIOXIDE, AND I SOLVED SULFATE FROM INTERSTIT WATER OF COASTAL MARSH SEDIMENTS
Louisiana State Univ., Baton Rouge. Coastal dies Inst.
T. Whelan.
Available from the National Technical Infor tion Service, Springfield, VA 22161 as AD-A 795, Price codes: A02 in paper copy, A0 microfiche. Estuarine and Coastal Ma Science, (1974) 2, p. 407-415, 2 tab., 4 fig., 16 re

Descriptors: *Carbon cycle, *Carbon diox Gases, *Sediments, *Methane, *Louisi *Coastal marshes, Tidal marshes, Muck s Swamp, Chlorides, Sulfates, Salinity, *Meth bacteria.
Identifiers: Marsh sediment, South Louisiana.

The depth distributions of dissolved meth total carbon dioxide, chloride, and sulfate i terstitial waters are reported from three environments in the coastal marsh sediment south Louisiana. Dissolved methane ranged f 8.0 x 10-3 to 7.2 ml/l, with each core demonstra a slight increase in concentration with depth. highest concentrations of methane were obse in the northern subenvironment of the ma which was low in salinity. Extraction u

ım of methane from whole sediment samples ated that a significant amount of gas is nt as bubbles. Total carbon dioxide ranges 110 to 410 ml/l. Carbon dioxide, extracted r vacuum, yielded carbon isotope ratio values 8.9 and -22.5 o/oo for the southern and ern areas, respectively. The total carbon de concentration in two areas was greater or equal to that predicted by the depletion of lved sulfate from microbial reduction esses. In one core, however, the total carbon de concentration was less than could be ac- ted for by the sulfate deficit. In general, e sulfate reduction was active or where the lved sulfate concentration was low, the con- ation of methane increased. (Katz)

RY MANURE UTILIZATION AND FIELD LICATION RATES,
Meyer, R. S. Rauschkolb, and E. Olson.
6). 14 p. 3 fig, 3 tab, 9 ref.

criptors: *Salts, *Nitrogen, *Crop response, trients, Liquid wastes, Solid wastes, Soil ile, Leaching, Denitrification, *Farm wastes. tifiers: *Dairy manure, Volatilization.

m concerning nutrient and other salt move- t in soils and their possible entry into water olies has caused researchers to examine dairy ure management practices. It has been found in storing solid wastes, deep percolation es of nutrients and salts can be prevented by disturbing the bottom of the pack. Also, liquid te storage ponds have been found to be self- ing. Both liquid and solid dairy wastes have n found to be beneficial when applied to crops. key to conserving nitrogen applied to the olands is to incorporate it into the soil as soon ossible in order to prevent denitrification or hing. Factors affecting nitrogen availability and conservation include: amount of nitrogen released for plant use, method of application, handling, storage between collection and use and rate of application. Excessive nitrogen from organic or inorganic sources may be leached to the water table. Improved manure management with less nitrogen loss will mean fewer total salts added to the soil, since less manure will be needed to meet the nitrogen requirements of crops. (Penrod-East Central)

INTERACTIONS OF BEEF CATTLE WASTES WITH SOIL,
F. A. Norstadt, and L. K. Porter.
In: Environmental Biogeochemistry, Vol. 2, Chapter 47, Ann Arbor Science, Ann Arbor, Michigan, p. 763-775, 1976. 4 fig, 7 tab, 8 ref.

Descriptors: *Soil profiles, *Cattle, *Feed lots, *Sampling, Groundwater, *Farm wastes, Water pollution sources.
Identifiers: *Manure pack, *Soil water tensions, *Soil temperature, *Soil gases.

A soil core study was conducted at a commercial feedlot in Fort Collins, Colorado in 1972. The soil was a silty-clay loam with a water table varying between 240 and 360 cm, according to season and irrigation scheduling of adjacent cropland. Two metal cylinders or caissons were installed to a depth of 450 cm in a nearly square pen. One was located two meters from the feedbunk concrete apron (area receiving the most animal traffic, urine and feces) and the other in the center, about 30 m away from the bunk caisson (area of less traffic and excretion.) A third caisson was located in a nearby alfalfa field for comparison. The lot was usually stocked at 30 m2 per animal. The caissons monitored five depths (15, 60, 90, 180, and 270 cm) for soil water tensions and soil temperatures and permitted sampling of soil gases and soil solutions. Study results indicated that differences in animal traffic and excretion distribution in the feedlot caused 2 distinct soil regions to develop -- one aerobic, and one anaerobic. The former was near the center of the lot, and the latter was along the concrete apron in front of the feedbunk. Essentially the feedlot surface was sealed and little if any water infiltrated and percolated. Soil water tensions were stable during the year in the upper feedlot soil profile as compared to alfalfa field. The composition of soil gases differed markedly among the 3 caisson sites. It was found that the soil and micro-organisms responded with interesting reactions not easily observed in cultivated soils. The authors concluded that a northeastern Colorado feedlot, stocked and managed as reported in the study, does not appear to be a hazard to soil and groundwater. (Penrod-East Central)

GROUND-WATER CONTAMINATION BY DISSOLVED NITRATE,
Missouri Univ., Columbia. Dept. of Geology.
W. D. Keller, and G. E. Smith.
Presented at 164th Meeting of Geological Society of America, Miami, Florida, 27 p. 3 fig, 3 tab.

Descriptors: *Nitrates, *Fertilizers, Geochemistry, *Missouri, Surveys, *Farm wastes, *Groundwater, *Water pollution sources, Dissolved solids.

This report is concerned with a brief comment on the geochemistry of the NO3 ion and a progress survey of high-nitrate subsurface water in Missouri. Nitrates in Missouri subsurface waters were investigated by collecting water from wells and springs. More than 5,000 water samples were collected and analyzed. Approximately 42 percent of the samples ranging from 12 to 75 percent of the samples from individual counties, contained over 5 ppm nitrogen. The dominant source of water-pollutant nitrate in Missouri water table was found to be nitrogenous waste material from farm feed lots. Heavy application of nitrate fertilizers on highly permeable, alluvial soils, may contribute to the nitrate content of water table wells. (Cartmell-East Central)
W77-01542

A HANDBOOK FOR ESTIMATING THE POLLUTION POTENTIAL OF BEEF, DAIRY, SHEEP AND SWINE FEEDLOTS IN THE NORTH CENTRAL REGION,
R. L. Mensch.
Project Report for Consulting Work Performed for the Farm Structures Division, Agricultural Engineering Department, University of Illinois, Urbana, June, 1971, 29 p. 18 fig.

Descriptors: *Feed lots, *Livestock, *Agricultural runoff, Cattle, Dairy industry, Sheep, Hogs, Climatic data, *Farm wastes, Water pollution.
Identifiers: *North Central U.S., *Pollution potential.

The primary objectives in preparing this handbook are: (1) present procedures so that non-engineers can make on-site evaluation of a feedlot's pollution potential, (2) simplify mathematics so they can be performed without a computer or slide rule, and (3) reduce the number of instruments needed in securing field data to a minimum. A literature review was conducted to pull together the various procedures and equations of evaluating a feedlot's pollution potential in order to provide a continuous evaluation of the system, going from one component to the next. Selected references are cited. Evaluation of a feedlot must include climatic data as well as other factors such as: number of animals, type of animals, ration, percentage of time during the year that the feedlot is in use, feedlot area, lot slope and slope length, and feedlot management. All factors are compiled into a two page worksheet for the computation of feedlot runoff pollution. (Penrod-East Central)

5C. Effects Of Pollution

TEMPERATURE VARIATION IN FIDDLER CRAB MICROHABITATS,
Texas Univ. at Austin, Port Aransas. Marine Science Inst.
L. W. Powers, and J. F. Cole.
Journal of Experimental Marine Biology and Ecology, Vol. 21, 1976, p 141-157, 7 fig, 4 tab, 26 ref.

Descriptors: Environmental effects, *Temperature, Behavior, *Crabs, Microenvironment, Adaptation, *Texas, Resistance, Water pollution effects, Lethal limit.
Identifiers: *Fiddler crabs, Uca panacea, Uca virens.

Data obtained from measurements of the thermal environment at the microhabitat level were used to evaluate seasonal, diel, and spatial patterns of activity of non-tidal fiddler crabs (Uca panacea and Uca virens). The crabs occupy a variety of microhabitats and were active at times during which thermal conditions were not extreme. Wider ranges of temperature and humidity were tolerated during the summer courtship display season. Nocturnal activity was possible during the winter because the heat wave arrives at the burrow terminus several hours after surface maximum. When low temperatures prevail night and day, the crabs remain inactive by day and night. Summer temperatures were high enough to permit activity by day and night. When summer temperatures were above the upper lethal limits, crabs limited their activities to morning and evening periods. (Chilton-ORNL)

NITROGEN FIXATION IN THE RHODE RIVER ESTUARY OF CHESAPEAKE BAY,
Maryland Univ. Baltimore County, Baltimore. Dept. of Biological Sciences.
T. V. Marsho, R. P. Burchard, and R. Fleming.
Canadian Journal of Microbiology, Vol. 21, No. 9, 1975, p 1348-1356, 5 fig, 2 tab, 23 ref.

Descriptors: *Laboratory tests, *Nitrogen fixation, *Estuaries, Sediments, Intertidal areas, Bacteria, *Chesapeake Bay, Plant growth, Water pollution effects, *Bioassay, Eutrophication.
Identifiers: Heterotrophic bacteria.

The reduction of acetylene to ethylene was used as an assay for determining the capacity of biological systems to fix molecular nitrogen in a Chesapeake Bay estuary. Studies conducted over a 15 month period showed that nitrogen fixation occurs predominantly in the surface intertidal and subtidal sediments. Seasonal variation in nitrogen fixation was found for intertidal sediments incubated at 20 C. Average rates of approximately 37 and 12 ng N/g dry sediment per hour were observed in late fall months of 1972 and 1973, and less than or equal to 5 ng N/g dry sediment/hour during other seasons. Incubation of samples at ambient temperatures resulted in lowered peaks of activity. Light-dark and substrate experiments suggested that heterotrophic bacteria were the principal agents for nitrogen fixation in sediments. Seasonal burst of nitrogen fixation potential was out of phase with the period of rapid plant growth. (Chilton-ORNL)

TEMPERATURE AND THE VERTICAL DISTRIBUTION OF TWO TIDEPOOL FISHES (OLIGOCOTTUS MACULOSUS, O. SNYDERI),
Southeastern Massachusetts Univ., North Dartmouth. Dept. of Biology.
R. Nakamura.
Copeia, No. 1, 1976, p 143-152, 4 tab, 6 fig, 34 ref.

Descriptors: Environmental effects, *Temperature, *Distribution, Distribution patterns, Fish, Fish behavior, Tides, Intertidal areas, Estuaries, On-site investigations, *Sculpins, Water pollution effects.
Identifiers: *Oligocottus maculosus, *Oligocottus snyderi.

The relationship between tide cycle, microhabitat, temperatures, microdistribution patterns and thermal physiology of Oligocottus maculosus and Oligocottus snyderi was studied. Temperature was found to vary greatly in tidepools with the magnitude of the variations being governed by the tide cycle and varying according to vertical position, time of day, and season. Distributional differences of the two species studied within the intertidal zone appeared to be mainly due to tidepool temperature regimes. The distribution of O. maculosus was ubiquitous in the intertidal zone while that of O. snyderi was restricted entirely to the lower intertidal zone where temperature regimes were cooler and more stable. (Chilton-ORNL)

DISTRIBUTION AND SIGNIFICANCE OF FECAL INDICATOR ORGANISMS IN THE UPPER CHESAPEAKE BAY,
Maryland Univ., College Park. Dept. of Microbiology.
G. S. Saylor, J. D. Nelson, Jr., A. Justice, and R. R. Colwill.
Applied Microbiology, Vol. 30, No. 4, October 1975, p 625-638, 7 tab, 8 fig, 13 ref.

Descriptors: *Water pollution effects, *Water quality, Waste water(Pollution), Domestic wastes, Sewage, Environmental effects, Shellfish, Recreation, Temperature, Salinity, Bays, *Chesapeake Bay, *Bioindicators, *Distribution, Coliforms, Bacteria, Enteric bacteria, Streptococcus, Aerobic bacteria.
Identifiers: Heterotrophic bacteria.

The survey reported upon provides evidence of significant levels of pollution from human wastes in the water, sediment, and suspended sediment throughout the Upper Chesapeake Bay. Highest counts of pollution indicator organisms were found at the confluence of the Susquehanna River and the Chesapeake Bay. Organisms were found to be quantitatively distributed independently of temperature and salinity and were not correlated with concentration of suspended sediment. However, 53% of total viable bacteria and more than 80% of fecal indicator organisms were directly associated with suspended sediments. Correlation coefficients for the indicator organisms ranged from 0.80 for bottom water to 0.99 for suspended sediment. Prolonged survival for the fecal streptocci was seen in most of the sediment samples. Further deterioration in water quality would seriously affect shellfish harvesting and recreational uses of the Upper Chesapeake Bay. (Chilton-ORNL)

HYDROGEN ION CONCENTRATION IN THE GASTROINTESTINAL TRACT OF CHANNEL CATFISH,
Georgia Agricultural Experiment Station, Savannah.
J. W. Page, J. W. Andrews, T. Murai, and M. W. Murray.
Journal of Fish Biology, Vol. 8, 1976, p 225-228, 2 tab, 8 ref.

Descriptors: Biochemistry *Aquatic animals, Fish, *Hydrogen ion concentration, Laboratory investigations, Temperature, *Channel catfish, Water pollution effects.
Identifiers: Gastrointestinal tract(Catfish).

Two groups of five channel catfish, with average weights of 892 and 134 g, were maintained at environmental temperatures of 23 and 28C. Highly acidic conditions were present in the stomachs of all fish with slightly higher pH values for the stomach contents of fish at 28C. The pH values increased to 7-9 in the duodenum and reached a maximum level of 8.6 in the upper intestinal region with a decrease approaching neutrality in the lower segments of the colon. Catfish of both sizes had a slightly lower pH throughout the intestinal tract at 28C than at 23C. The pH of the bile ranged from 6.1 to 7.5 and was higher in fish maintained at 28C. (Chilton-ORNL)

ODELING PHYTOPLANKTON BLOOMS IN A RATIFIED EMBAYMENT,
tah Water Research Lab., Logan.
. J. Grenney.
ccasional Paper 8, June 1975. 24 p, 5 fig, 41 ref.

escriptors: *Phytoplankton, *Mathematical odels, *Simulation analysis, *Water quality, ydrodynamics, *Ecosystems, Nitrogen, utrients, Storage, Light intensity, Temperature, nvironment, Convection, Dispersion, Equations, ystems analysis, Growth rates, *Eutrophication, ater pollution effects.
entifiers: Auke Bay(Alaska), Biological models.

mathematical model has been developed to mulate the nitrogen limited growth dynamics of ytoplankton in a stratified embayment. The presentation of biological growth dynamics in udes consideration of intracellular nutrient orage as well as the effects of temperature and ght intensity. Several competing species can be presented simultaneously. Model hydrodynam s represent the effects of vertical mixing in the ater column on the physical distribution of utrients and phytoplankton. Sinking velocities of e cells are also included. The model was applied Auke Bay, Alaska, and model responses are mpared to data observed during the spring and mmer of 1967. The model indicates that ytoplankton populations decrease rapidly with creasing sinking velocity. In conclusion, cosystems present unique problems for quantita ve description and prediction. Mathematical odels, although less than perfect, can be power l tools for analyzing these systems. An optimal alance between accuracy and practicability must e sought. (Bell-Cornell)

THE EFFECTS OF THERMAL EFFLUENT ON THE AMERICAN OYSTER, CRASSOSTREA VIRGINICA GMELIN IN INDIAN RIVER BAY, DELAWARE,
Delaware Univ., Newark. Coll. of Marine Studies.
J. Tinsman, and D. Maurer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-246 410, Price codes: A06 in paper copy, A01 in microfiche. July 1976, 114 p, 8 tab, 14 fig, 148 ref.

Descriptors: *Thermal stress, Thermal water, *Thermal pollution, Thermal power, *Thermal power plants, *Oysters, Mollusca, Effluents, *Estuaries, *Estuarine environment, Estuarine fisheries, *Industrial wastes, Growth rates, Reproduction, Seasonal, *Delaware, Bays.
Identifiers: *Indian River Bay(Delaware), Glycogen content, *Crassostrea virginica, *Oyster growth, Meat weight.

This report was undertaken in order to determine some of the effects of the thermal discharge from the Delaware Power and Light Company plant at Millsboro, Delaware, on the American oyster, Crassostrea virginica (Gmelin), placed in Indian River Bay. The objectives of the project were to trace the survivorship, growth, condition, and reproductive behavior of oysters held in the thermal effluent and at control stations. The samples were taken from August 1970 to May 1971. The heated effluent had the effect of shortening and modifying the severity of the winter, thereby increasing the growing season. Oysters in the effluent showed the greatest shell growth throughout the study. Meat weights and glycogen concentration in the effluent were highest of all the stations in the winter. Summer conditions in the effluent were severe due to excessively high temperatures and meat weights and glycogen concentrations were lower than at other stations. In the spring, spawning may have occurred prematurely in the effluent at station two, which was located 2.5 km downstream at the mouth of the effluent canal. The study showed that the thermal effluent has both beneficial and detrimental effects depending on the season. (Katz)

INVESTIGATION OF SELECTED POTENTIAL ENVIRONMENTAL CONTAMINANTS, CHLORINATED PARAFFINS,
Syracuse Univ. Research Corp., N.Y.
P. H. Howard, J. Santodonato, and S. J. Saxena.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 634, Price codes: A06 in paper copy, A01 in microfiche. Environmental Protection Agency, EPA 560/2-75-007, TR 75-622, November 1975. 109 p, 36 tab, 3 fig, 111 ref.

Descriptors: *Organic compounds, *Chlorinated hydrocarbons, *Chemicals, *Toxicity, Environmental control, Pathology, Analytical techniques, Human diseases, Human pathology, Plants, Microorganisms, Bioassays, Oil industry, Environmental effects, Public health.
Identifiers: Environmental contaminants, *Chlorinated paraffins, Chlorowax, Oil additives, Plasticizers, Flame retardants.

This report reviews the potential environmental hazard from the commercial use of chlorinated paraffins. Chlorinated paraffins, in most cases, contain 10 to 30 carbon atoms and a chlorine content of 40-70%. They are used as lubricating oil additives, secondary plasticizers, and flame retardants. Information on physical and chemical properties, production methods and quantities, commercial uses and factors affecting environmental contamination, as well as information related to health and biological effects, are reviewed. MINERAL REQUIREMENTS IN FISH--II. MAGNESIUM REQUIREMENT OF CARP,
Tokyo Univ. of Fisheries, 4, (Japan). Lab. of Fish Nutrition.
C. Ogino, and J. Y. Chion.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 42, No 1, p 71-75, 1976. 5 tab, 1 fig, 10 ref.

Descriptors: *Magnesium, *Nutrient requirements, *Nutrients, *Carp, *Deficient elements, *Fish diets, *Calcium, *Fish physiology, *Growth rates, Essential nutrients, Fish diseases, Metabolism, Metals, Laboratory tests, Mortality, Methodology.
Identifiers: *Mineral needs.

Magnesium deficiency in carp was found to produce a loss of appetite, poor growth, high mortality, sluggishness and convulsions. The minimal requirement of young carp for magnesium was 0.04 to 0.05 per cent of a dry diet of 12 to 15 mg per kg body weight per day under the experimental

conditions. The magnesium content of vertebrate from carp fed diets containing low magnesium decreased significantly while the calcium content increased slightly. Thus, the values for Ca/Hg of the vertebrae were changed by the dietary magnesium level. (Katz)

Descriptors: *Algae, *Bioassay, *Toxicity, *Pesticide residues, *Triazine pesticides, *Organic pesticides, *Aminotriazole, *Herbicides, Environmental effects, Water quality control, Laboratory tests, Water pollution effects.
Identifiers: Poecilia sp, Ankistrodesmus sp, Simazin, Atrazin, Propazin, Desmetryn, Ametryn, Prometryn, Amitrol, Azaplant, Guppies.

The toxic effects of Simazin, Atrazin, Propazin, Desmetryn, Ametryn, Prometryn, Amitrol and Azaplant on Ankistrodesmus falcatus and Poecilia reticulata were examined. At threshold concentrations of less than 1 mg/l the Triazines are highly toxic to Ankistrodesmus, and at threshold concentrations of less than 10 mg/l they are highly toxic for Poecilia. For the six Triazines, relationships exist between the toxicity to algae and the chemical structure. With a wetting agent added, Azaplant is more toxic to fish than the pure agent. The highest allowable herbicide concentrations are given. (Katz)

THE EFFECT OF TEMPERATURE ON THE BEHAVIOR OF YOUNG TAUTOG, TAUTOGA ONITIS (L.),
National Marine Fisheries Service, Highlands, N.J. Sandy Hook Lab.
B. L. Olla, and A. L. Studholme.
In: Proceedings 9th European Marine Biology Symposium, H. Barnes, ed., Aberdeen University Press, 1975, p. 75-93, 4 tab., 5 fig., 16 ref.

Descriptors: *Temperature, *Fish behavior, *Environmental effects, *Benthic fauna,*Heated water, *Feeding rates, *Social behavior(Animal), *Juvenile fish, Laboratory test, Bottom fish, Food habits, Habitats, *Thermal pollution, *Thermal stress.
Identifiers: *Tautoga onitis, Tautog.

A series of experiments were conducted to investigate the effect of temperature on the activity, feeding, and shelter dependency of young tautog, Tautoga onitis, an inshore resident of the Atlantic coast from Nova Scotia to South Carolina. For each experiment, two fish were held under controlled laboratory conditions in one of two experimental systems while observations of activity, time spent in the tile shelter, aggressive encounters, and amounts ingested during feeding were recorded. As temperature was increased the various patterns were modified with activity, aggression, and feeding reduced and association with shelter increased. Five of the experimental fish, including two which had lost equilibrium, resumed normal activity and feeding when temperature was lowered to acclimation levels. (Katz)

METABOLIC ADAPTATIONS ON THE AEROBIC-ANAEROBIC TRANSITION IN THE SEA MUSSEL, MYTILUS EDULIS L.,
Utrecht Rijksuniversiteit (Netherlands). Lab. of Chemical Animal Physiology.
A. DeZwaan, A. M. T. deBont, and J. H. F. M. Kluytmans.
In: Proceedings 9th European Marine Biology Symposium, Harold Barnes, ed. Aberdeen University Press, 1975. p 121-138. 3 fig., 5 tab., 16 ref.

Descriptors: *Metabolism, *Amino acids, *Anaerobic conditions, *Aerobic conditions, Biochemistry, Tracers, Animal physiology, *Respiration, *Shellfish, Environmental effects, Methodology, Analytical techniques, Laboratory tests, Crustaceans, Invertebrates, Carbon radioisotopes, *Oxidation-reduction potential, *Mussels.
Identifiers: *Mytilus edulis, *Metabolic pathways.

The distribution of radioactivity over different classes of chemical compounds from marked glucose and glutamate in the sea mussel Mytilus edulis was examined after 2.5 n of aerobiosis and anaerobiosis. The anaerobic condition was started 15 h preceding the injection of the precursor. The switch to aerobic conditions caused inhibition in the conversion of glutamate, but the conversion of glucose was unaffected. For both precursors under anaerobic conditions the organic acids and amino acids together accounted for about 90% of the radioactivity, and under aerobic conditions for about 55%. Only alanine, aspartate and glutamate were involved. The influence of 17.5 h anaerobiosis on the concentration of glycogen, glucose, succinate, aspartate, glutamate, and alanine were studied. Only succinate showed a marked change, rising by a factor of 10. The results indicate that glutamate is used under both conditions but that the main source of succinate during anaerobiosis is carbohydrate. Glutamate only plays a minor role in the maintenance of the redox balance. (Katz)

LCH FLUCTUATIONS IN MYTILUS EDULIS L. IN RELATION TO SHELL MOVEMENTS UNDER AEROBIC AND ANAEROBIC CONDITIONS,
Utrecht Rijksuniversiteit (Netherlands). Lab. of Chemical Animal Physiology.
T. C. M. Wijsman.
Proceedings, 9th European Marine Biology Symposium, Harold Barnes, ed., Aberdeen University Press, 1975. p. 139-150, 8 fig., 1 tab., 21 ref

Descriptors: *Mussels, *Hydrogen ion concentration, *Acidity, *Environmental effects, *Bioassay, *Animal behavior, *Behavior, *Movement, *Animal physiology, *Aerobic conditions, *Anaerobic conditions, *Shellfish, *Metabolism, Water properties, Laboratory tests, Methodology, Crustaceans, Invertebrates, Enzymes, Biochemistry.

Continuous recordings of shell movements and pH in the extrapallial fluid of Mytilus edulis have been made under aerobic and anaerobic conditions. Short-term measurements of the pH in the foot were made after various periods of exposure to air. In both cases the pH decreases more than 0.3 units within 5 h of shell closure and after 1 day pH values of about 6.6 were obtained, caused by pH reductions of 0.5 to 0.9 units. If the mussel opens its shell on return to sea water, the pH reaches normal values of 7.3 to 7.5 within 2 hrs. A physiological significance of the pH reduction during anaerobiosis is found in the pH-dependence of the enzyme activities of pyruvate kinase and phosphoenolpyruvate carboxykinase. (Katz)

Identifiers: Bream.

Investigations have been made for several ye on the influence of warm cooling water on fish macroinvertebrates around the Flevo power tion. Changes in the macroinvertebrates limited to small area around the outlet where t peratures are relatively high. These changes cluded increased growth rate, earlier hatchin eggs and population variations. With a few exc tions all of the more commonly occurring spec were found near both the intake and the out Fish were markedly more abundant near the ou than elsewhere in the lake. Negative effects fish condition were found in pike-perch bream. The spawning time of roach was advan by about two weeks near the outlet. (Katz)

THE EFFECTS OF MIREX AND METH YCHLOR ON THE GROWTH AND PROD TIVITY OF CHLORELLA PYRENOIDOSA,
Wheaton Coll., Norton, Mass. Dept. of Biology
J. C. Kricher, J. C. Urey, and M. L. Hawes.
Bulletin of Environmental Contamination Toxicology, Vol. 14, No. 5, p. 617-620, 197 tab., 8 ref.

Descriptors: *Chlorinated hydrocarbon pestic *Pesticides, *Insecticides, *Primary productiv *Bioassay, Chlorella, *Algae, *Aquatic pop tions, *Growth rates, Photosynthesis, Laborat tests, Water pollution effects, Aquatic pla Aquatic algae, Plant growth.
Identifiers: *Mirex, *Methoxychlor, *Chlor pyrenoiodosa.

The effects of mirex and methoxychlor, chlorinated hydrocarbon pesticides, on the po lation growth of Chlorella were examined. Pop tions treated with 100 ppb mirex were depres by 8 ompared to controls after 92 hr. The po lation density was 19% below that of the contro the end of the experiment after exposure to mi Populations treated with 100 ppb methoxych were 17% lower than controls when the exp ment was ended. The populations exposed to ppb mirex and 50 ppb methoxychlor in combi tion showed little deviation from the con group. This suggests that the two pesticides ef different physiological processes and that 50

each pesticide was below the toxicity threshold r Chlorella. (Katz)

escriptors: *Metabolism, *Ammonia, *Nitrogen mpounds, *Salmon, *Sockeye salmon, Diurnal, *Oxygen, *Ureas, Laboratory tests, orhythms, Aquiculture, Fish hatcheries, Fish anagement.

easurements of the rate of ammonia and urea cretion of fingerling sockeye salmon ncorhynchus nerka) (average weight -29 grams) ere made at 2-3-hourly intervals throughout the y. One group of fish was fed a maintenance ra- on while another group was starved for 22 days. mmonia excretion rose to a sharp peak of 35 mg /kg per hour, 4-4.5 h after the start of feeding (at 30) and fell to a baseline level of 8.2 mg N/kg per ur between 0200 and 0800. Urea excretion mained relatively steady at a mean rate of 2.2 mg /kg per hour throughout the day, showing no urnal response to feeding. Starved fish showed a trogen excretion rate close to that for both the eady state of urea excretion and the baseline rate ammonia excretion of the fed fish. Oxygen con- mption rose to 370 mg 02/kg per hour just before d during a 1-h feeding period, decreasing to a w of 170 mg 02/kg per hour at 0300 h. For the arved fish this diurnal metabolic fluctuation con- nued from the start in a variable and diminishing rm whereas nitrogen excretion showed no such sponse. It is concluded that for nonstressed sal- on at 15C ammonia is the chief excretory roduct of exogenous nitrogen metabolism. (Katz)

YNERGISM OF INHIBITING ACTIONS OF EAVY METALS UPON THE FERTILIZATION ND DEVELOPMENT OF SEA URCHIN EGGS, N JAPANESE),
oshisha Univ., Kyoto (Japan). Biological Lab.
. Kobayashi, and K. Fujinaga.
he Science and Engineering Review of Doshisha niversity, Vol. 17, No. 1, p. 54-69, April, 1976. 7 b., 2 fig., 13 ref.

escriptors: *Reproduction, *Heavy metals, Copper, *Zinc, *Nickel, *Cadmium, Fertilization, Water pollution effects, *Growth tes, *Growth stages, Animal pathology, Eggs.
dentifiers: *Synergistic effects, *Anthocidaris ., *Hemicentrotus, Sea urchin eggs.

he effects of copper, zinc, nickel and cadmium n fertilization, cell division, and gastrulation of ea urchin eggs were studied, both as individual etals and paired. Hemicentrotus pulcherrimus nd Anthocidaris crassispina were exposed to con- entrations of metals at 2, 4, and 8 times the max- num level of non-inhibition. Hemicentrotus was ore sensitive to the effect of heavy metals than as Anthocidaris. Decreased fertilization rates, ell division, and gastrulation resulted from heavy etals exposure as did the appearance of olyspermy, permanent blastula and exogastrula, nd delay of development. Strong synergistic ef- ects occurred with Cu plus Zn, and less strongly ith Cu plus Cd and Zn plus Cd. Cu plus Ni, Zn lus Ni, and Ni plus Cd resulted in an additive in- ibition. (Katz)

COMPARATIVE MORTALITY STUDIES ON BIOMPHALARIA GLABRATA (MOLLUSCA: PULMONATA) EXPOSED TO COPPER INTERNALLY AND EXTERNALLY,
Lehigh Univ., Bethlehem, Pa. Inst. for Pathobiology.
J. T. Sullivan, and T. C. Cheng.
Journal of Invertebrate Pathology, Vol. 28, p. 255-257, 1976. 1 fig., 3 ref.

Descriptors: *Copper, Animal physiology, *Animal pathology, *Snails, *Toxicity, *Mortality, *Mode of action, *Path of pollutants, Metals, Gastropods, Invertebrates, Methodology, Mollusks.
Identifiers: *Biomphalaria glabrata, Copper sulfate.

Various concentrations of copper in the form of CuS04 were injected into the hemocoel of Biomphalaria glabrata, and mortality of this snail was subsequently monitored. The concentrations of copper in the hemolymph of injected snails were calculated, and specimens were incubated in these concentrations. Greater mortality was observed when snails were incubated in concentrations of copper than when they were injected with a sufficient amount of copper to attain these same concentrations in the hemolymph. Injection of copper into the hemocoel of B. glabrata resulted in the formation of a noncellular hemolymph precipitate, most likely denatured proteins, at the injection site, which was most noticeable with higher concentrations of copper. It has been concluded that external concentrations of copper are more cidal to B. glabrata than are internal, i.e., injected, concentrations. These data support the hypothesis that the cidal action of copper on B. glabrata is due to an attack on the mollusc's surface epithelia. (Katz)

PCB CONTENTS IN MARINE ANIMALS COLLECTED IN THE EAST CHINA SEA, (IN JAPANESE),
Hokkaido Univ., Sapporo (Japan). Lab. of Food Hygiene.
M. Takagi, A. Iida, and S. Oka.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 42, No. 7, p. 753-759, 1976. 3 tab., 4 fig., 19 ref.

Descriptors: *Polychlorinated biphenyls, *Absorption, *Path of pollutants, *Marine animals, *Pesticide residues, Chlorinated hydrocarbon pesticides, Water Pollution Sources, Analytical techniques, Pacific Ocean.
Identifiers: *East China Sea, Tissue analysis, *Kanechlor-600.

Twenty one species of marine animals were collected from the East China Sea. Muscle and liver tissues were analyzed for polychlorinated biphenyl (PCB) concentrations. PCB concentrations in muscle ranged from 0.01-0.06 ppm and from 0.08-0.28 ppm in liver. Bloody muscle contained higher PCB concentrations than did ordinary muscle. Kanechlor-600 (KC-600) was absent from muscle, but distinctly present in liver of all marine animals tested except Fugu chinensis. The median and standard deviation of the PCB concentration in muscle tissue showed 0.018 ppm and 0.250 ppm, respectively. Consequently, the degree of pollution with PCB of marine animals in the East China Sea was found to be very low as compared with that of fish from other areas. (Katz)

ACUTE TOXICITIES OF CRUDE OILS AND OIL-DISPERSANT MIXTURES TO RED SEA FISHES AND INVERTEBRATES,
Hebrew Univ., Jerusalem (Israel). Heinz Steinitz Marine Biology Lab.
R. Eisler.
Israel Journal of Zoology, Vol. 24, p. 16-27, 1975. 7 tab., 10 ref.

Descriptors: *Oil, *Oil wastes, *Toxicity, *Bioassay, *Mollusks, *Lethal limit, Water pollution sources, *Crustaceans, *Marine fish, Marine animals, Stress, *Pollution abatement, Water pollution effects, Invertebrates, Coral, Laboratory tests, Benthic fauna, Oil spills, Gastropods, Mussels, Animal behavior.
Identifiers: *Oil dispersants, *Crude oil, Heteroxenia fuscescens, Nerita forskali, Drupa granulata, Mytilus variabilis, Palaemon pacificus, Siganus rivulatus, *Persian Gulf, Gulf of Elat, *Red Sea.

Crude oil from fields in the Persian Gulf and in the Sinai plus a chemical oil dispersant were tested, using static bioassay procedures, for toxicity to adults or juveniles of ten marine species: Heteroxenia fuscescens, a soft coral; Nerita forskali and Drupa granulata, gastropod molluscs; Mytilus variabilis, a mussel; Acanthopleura haddoni, a chiton (mollusc); Echinometra mathaei, sea urchin; Calcinus latens, a hermit crab; Palaemon pacificus, a shrimp; Parupeneus barberinus, goatfish; and Siganus rivulatus, rabbitfish. Concentrations fatal to 50% of individual test species in 168 hours, LC-50 (168 h), ranged from 0.74 to more than 30.0 ml/liter for Persian Gulf crude, from 14.5 to more than 30.0 ml/liter for Sinai crude, and from 0.006 to 0.064 ml/liter for the dispersant. In general, fishes and crustaceans were the most sensitive groups assayed and molluscs the most resistant. LC-50 (168 h) values for oil-dispersant

mixtures of 10 parts oil t 1 part dispersant (v/v) for selected species ranged from 0.047 to 0.152 ml/liter which appears to reflect the biocidal properties of the dispersant. Some individuals that survived immersion in high concentrations of the test compounds for 168 h were adversely affected during treatment and afterwaRDS. (Katz)

HEAVY METAL AND CHLORINATED HYDROCARBON RESIDUES IN CALIFORNIA SEA LIONS (ZALOPHUS CALIFORNIANUS CALIFORNIAUS),
Oregon State Univ., Corvallis. Dept. of Agricultural Chemistry.
D. R. Buhler, R. R. Claeys, and B. R. Mate.
Journal of the Fisheries Research Board of Canada, Vol. 32, p. 2391-2397, 1975. 4 tab., 28 ref.

Descriptors: *Heavy metals, Path of pollutants, *Absorption, *Chlorinated hydrocarbon pesticides, *Pesticide residues, *Mammals, *Animal pathology, Animal physiology, DDE, Cadmium, Mercury, Environmental effects, Animal diseases, Polychlorinated biphenyl, DDD, DDT, Metabolishm, *Pollutant indentification.
Identifiers: Zalophus californianus calfornianus, *California Sea Lion, Tissue analysis, *Methylmercury, Bioaccumulation.

Samples of various tissues and organs from healthy California sea lions and sick animals (apparently with leptospirosis) collected along the central Oregon coast from 1970 to 1973 were analyzed for total mercury, methylmercury, cadmium, and chlorinated hydrocarbons. Maximum mercury concentrations of 74-170 ppm occurred in sea lion liver, with only 1.6-3.7 percent as methylmercury. Cadmium was concentrated primarily in the kidney which contained 7.2-12.0 ppm of the metal. Chlorinated hydrocarbon residues in sea lion fat ranged between 253-475 ppm DDE, and 21.4 and 34.1 ppm PCB. Although mercury, cadmium, and chlorinated hydrocarbon residues in some of the sick sea lions were significant higher than those present in healthy animals, it is possible to relate these differences to the onset of leptospirosis. (Katz)

LATENT EFFECTS OF IRANIAN CRUDE OIL AND A CHEMICAL OIL DISPERSANT ON RED SEA MOLLUSCS,
Hebrew Univ., Jerusalem (Israel). Heinz Steinitz Marine Biology Lab.
R. Eisler.
Israel Journal of Zoology, Vol. 22, p. 97-105, 1973. 2 tab., 4 fig., 8 ref.

Descriptors: Animal physiology, *Pollution abatement, Oil, Water pollution effects, Environmental effects, *Reproduction, *Predation, *Gastropods, *Feeding rate, *Oil pollution, Stress, Mussels, *Mollusks, Invertebrates, Productivity, Dispersion, Oil spills, Laboratory tests, Food habits, Inhibitors, Physiological ecology.
Identifiers: *Sublethal effects, *Mytilus variabilis, *Oil dispersants, Drupa granulata, *Red Sea mollusks.

Predation rate of the gastropod drill, Drupa granulata, on the mussel, Mytilus variabilis, was measured over a period of 28 days after adults from both species had been immersed for 168 h in seawater solutions containing high sublethal concentrations (10 ml/liter) of Iranian crude oil. Predation rate was three times higher in controls than in the group where both predator and prey had been exposed initially; intermediate values were determined among groups where only one species had been trated initially. Fecundity of drills, as evidenced by number of egg cases deposited, was directly related to mussel consumption. In a similar study with a chemical oil dispersant, exposure to high (0.003 ml/liter) sublethal levels for 168 h did not affect markedly the rate at which mussels were destroyed an consumed during post-treatmet. However, the fecundity of untreated drills feeding on untreated mussels (controls) was 3 to 10 times greater than among groups in which one or both species had been exposed initially to dispersant. Except for mussels consumed by drills, there were no deaths during the post-treatment period in either study, and all organisms appeared normal. (Katz)

VER GREEN BAY. AN EVALUATION OF STING AND HISTORICAL CONDITIONS,
consin Dept. of Natural Resources, Madison.
pstein, M. Bryans, D. Mezei, and D.
erson.
ort No. EPA-905/9-74-006, June 1974. 293 p. 30 24 tab., 71 ref., 11 append.

criptors: *Bays, *Lake Michigan, *Water pol-n effects, *Data collections, *Wisconsin, Ox-n sag, Eutrophication, Water pollution control, er pollution sources, Biochemical oxygen de-d, Benthic fauna, Bottom sediments, Silting, utaries, Water circulation, Attitudes, Compet-uses, Pulp wastes, Pulp and paper industry, te treatment, Sewage effluents, Alkalinity, rients.
ntifiers: *Green Bay(Lake Michigan), Fox er(Wis), Oconto River(Wis), Peshtigo er(Wis), Menominee River(Wis).

Fox River remains the major pollution source Green Bay. The BOD-5 and suspended solids harges from paper mills along the river are approximately what they were 20 years ago r an intermidiate period of higher lings;BOD-5 loadings from sewage plants have n in the past ten years along the Lower Fox er depositing a high content of sludge at the ex-ne end of the bay. Below Sturgeon Bay there several areas where the depth has substantially reased during the past 17 years, an indication the bay is filling at a higher rate than larger ies of water. A change in commercial fish spe-has occurred since 1900 representing a shift n high quality native species to low quality ex-s. If pollution of the bay continues the bottom na will become the type associated with gross lution, a larger abiotic area around the river ith can be expected, midge larvae abundance ld decrease further north, and Oligochaetes ld become even more dominant. Data for pulp te loadings to the Lower Fox River, sewage ef-nts, estimated phosphorus loadings through utaries to the bay, nitrogen concentrations, pended solids, chlorides, light transparency, ductivity, fish species, bottom fauna and dis-ved oxygen concentrations are compared ween 1938 to 1970. ntifiers: Cladophora glomerata.

cedures for laboratory culturing of dophora, a nuisance green alga in the Great kes, were developed. Cladophora glomerata st have external vitamins B-1 and B-12 sup-s. With added vitamins, Cladophora can be cul-ed in completely defined media. When evalu-d as critical cell concentrations (minimum con-trations which permit optimum growth), dophora had relatively low nitrogen and sphorus requirements and very high boron and fur requirements. Cladophora can use am-nia- and nitrate-nitrogen and ortho-, pyro-, ta-, and tripoly-phosphorus for growth, but phosphite-phosphorus was relatively unavailable. Cladophora phosphorus concentrations from all the Great Lakes correlated with pollution of specific areas; phosphorus was limiting or close to limiting in areas with little pollution. Phosphorus reduction might be a practical way to reduce Cladophora growth. Nitrogen was not limiting, but boron and possibly zinc and vitamin B-1 may be. Plant bioassays are recommended to evaluate nutrient supplies and growth-limiting nutrients for Cladophora in Natural environments. Critical concentrations and the range of concentrations of nitrogen, phosphorus, calcium, magnesium, potassium, sulfur, iron, zinc, manganese, copper, molybdenum, and boron were determined. Cladophora appeared relatively insensitive to high temperature with optimum yields maintained at 30-31C. Its growth was reduced to 63% of optimum at 16-17.5C. (Buchanan-Davidson--Wisconsin).

WORKSHOP ON TOXICITY TO BIOTA OF METAL FORMS IN NATURAL WATER.
International Joint Commission-United States and Canada.
Held October 7-8, 1975 at Duluth Minnesota. R. W. Andrew, P. V. Hodson and D. E. Konasewich, editors. April 1976. 333 p.

Descriptors: *Heavy metals, *Toxicity, *Great Lakes, *Water quality standards, International Joint Commission, Conferences, Organic compounds, Mode of Action, Mathematical models, Chemical reactions, Pollutant identification, Air environment, Absorption, Biota, Persistence, Distribution, Food webs, Fish, Algae, Bottom sediments, Suspended solids, Chelation, Marine algae, Lethal limit, Solubility, Absorption, Analytical techniques, Speciation, Molecular structure.
Identifiers: Synergistic effects, Antagonistic effects, Additive effects, Toxic units, Metal detoxification, Bioaccumulation, Stability constants, Application factor.

This proceedings focused on the current knowledge concerning the toxicity and availability to aquatic biota of various forms and molecular complexes of metals to assist the International Joint Commission's Water Quality Board in developing water quality objectives for the Great Lakes. The chemistry of heavy metals was reviewed and the total, soluble, particulate, extractive, colloidal, chelated, complexed, bound, hydroxides, chlorides, carbonates and sulfates were considered in terms of total metal. Of prime interest was the relationship of metal forms to toxicity, and if that can be established, how it can be measured with sufficient sensitivity and accuracy. Presentations discussed the molecular structure-activity relations and their toxicity, and metal speciation and their toxicity. Other contributions discussed heavy metal standards on the basis of their dissolved forms, effects of organic pollutants on copper toxicity to fish, copper toxicity to phytoplankton as affected by organic ligands, other cations, and algal tolerance. Presentations also dealt with complexation of metals, potential roles of metal-ligands in seawater, distribution and bioaccumulation of mercury, pharmokinetic approaches to the evaluation of methylmercury to fishes, molecular forms of arsenic, and additive actions and interactions in the toxicity of mixtures of heavy metals and organic compounds. The final chapter is devoted to a comprehensive discussion and research needs. (See W77-01296 thru W77-01309) (Auen-Wisconsin)

COMPLEXATION OF METALS IN NATURAL WATER,
Canada Centre for Inland Waters, Burlington (Ontario).
Y. K. Chau, and P. T. S. Wong.
In: International Joint Commission's Workshop Proceedings 'Toxicity to Biota of Metal Forms in Natural Water', October 7-8, 1975, Duluth, Minn. p 187-196, April 1976. 3 fig, 1 tab, 9 ref.

Descriptors: *Heavy metals, *Toxicity, *Chelation, Organic matter, Copper, Algae, Canada, Lead, Zinc, Nickel, Scenedesmus.
Identifiers: Metal detoxification, Ligands, Ankistrodesmus falcatus, Sudbury(Ontario).

A significant fraction of the trace metals in waters is believed to exist in complexed forms with miscellaneous organic ligands, whose abundance and complexing characteristics regulate the availability of heavy metals to biota. The forms of metals, toxic effects, complexing capacity of water and its effect in ameliorating metal toxicity are discussed. Tests conducted with lake waters in the Sudbury, Ontario, district showed a correlation between complexing capacity with either dissolved organic carbon or dissolved organic nitrogen or both. The relationship between complexing capacity of a lake and algal growth was studied with Ankistrodesmus falcatus in waters containing high concentrations of zinc, nickel, copper and lead, and all exhibited varying degrees of toxicity. Further experiments on the relationship between complexation and toxicity reduction to algae with Scenedesmus quadricauda were conducted with 500 ppb lead, with various degrees of growth inhibition. The toxic effects of metals in an aquatic system depend greatly on several factors, with complexing capacity the most significant; other factors affecting toxicity are alkalinity, hardness, nutrient concentration and pH. Unless it is possible to vary the complexing capacity of water samples without changing the other parameters, the sole effect of complexing capacity cannot be quantitatively assessed. At present it is impossible to vary the amount of ligands without altering the other parameters. (See also W77-01295) (Auen-Wisconsin)

DISTRIBUTION AND BIOACCUMULATION OF MERCURY IN BIOTIC AND ABIOTIC COMPARTMENTS OF A CONTAMINATED RIVER-RESERVOIR SYSTEM,
Oak Ridge National Lab., Tenn.
S. G. Hildebrand, A. W. Andren, and J. W. Huckabee.
In: International Joint Commission's Workshop Proceedings 'Toxicity to Biota of Metal Forms in Natural Water', October 7-8, 1975, Duluth, Minn. p 211-230, April 1976. 4 fig, 5 tab, 30 ref. NSF (RANN) AG-389.

Descriptors: *Mercury, *Biota, *Distribution, Benthos, Fish, Food webs, Absorption, Virginia, Tennessee, Bottom sediments, Suspended solids, Shiners, Suckers, Rock bass, Heavy metals.
Identifiers: *Bioaccumulation, *Methylmercury, North Fork Holston River(Va), Cherokee Reservoir(Va), Hogsuckers, Chlor-alkali plant.

Studies were conducted in the North Fork of the Holston River-Cherokee Reservoir, Virginia, which receives leached mercury from an abandoned chlor-alkali plant's waste disposal ponds, to determine the behavior and ultimate fate of mercury in that system. The dissolved mercury is rapidly adsorbed onto suspended particulates and the major downstream transport of mercury appears to take place in the particulate phase. Total mercury and methylmercurials in fish and benthic invertebrate taxa were highest immediately below the source then decreased downstream. The pattern was similar to the downstream distribution of mercury in water and sediments. Total mercury in rockbass 83 miles downstream from the source exceeded 1.0 ppm. Approximately 80% of mercury in rock bass, hogsucker, and shiners in the river was methylmercury and on the order of 50% of mercury in benthic invertebrates was methylmercury. No methylmercury had been detected in river bed sediments. Dietary uptake of methylmercury by fish feeding on benthic invertebrates may be a significant route of entry of methylmercury into food webs but the mechanism of accumulation of methylmercury in the three fish species is unresolved. ZINC SPECIATION AND TOXICITY TO FISHES,
Montana State Univ., Bozeman. Dept. of Chemistry.
G. K. Pagenkopf.
In: International Joint Commission's Workshop Proceedings 'Toxicity to Biota of Metal Forms in Natural Water', October 7-8, 1975, Duluth, Minn. p 77-91, April 1976. 3 fig, 5 tab, 23 ref.

Descriptors: *Zinc, *Toxicity, *Fish, *Chemical properties, Model studies, Speciation, Reviews, Atlantic salmon, Bioassay, Minnows, Rainbow trout, Sunfishes.
Identifiers: Bluegills, Fathead minnows, Goldfish, Guppies, Zebrafish, Chemical constants.

A variety of bioassay experiments defining zinc speciation and a model of zinc solubility are discussed. One extreme of the model is that all of the zinc carbonate solid phase has formed, however, the particle size is small and precipitation has not occurred. The other extreme assumes that no solid phase is formed. The literature survey indicates that there is sufficient analytical data to permit calculations of zinc speciation. The data includes pH, alkalinity, hardness (Ca and Mg), sulfate concentration and LC50 of zinc. Data is available for fathead minnows, bluegills, rainbow trout, goldfish, guppies, zebrafish and Atlantic salmon. The studies indicate that the presence of calcium and magnesium reduces the effect of zinc. An increase in pH from 6 to 8 is accompanied by a sizable reduction in zinc LC50. Usually this change is pH is accompanied by an increase in the amount of solid zinc carbonate present. It is not recommended that these acute toxicity studies be utilized for establishing zinc toxicity limits, as the precise formation of the zinc solid phase is unknown. Fish may tolerate predicted soluble zinc levels, at least for short periods, in waters of average hardness, alkalinity and pH. The toxicity of elevated zinc levels depends on the rapidity of its precipitation. (See also W77-01295) (Auen-Wisconsin)
W77-01298

STRUCTURE-ACTIVITY RELATIONS AND THE TOXICITY OF TRACE ELEMENTS TO AQUATIC BIOTA,
Atlantic Biological Station, St. Andrews (New Brunswick).
V. Zitko.
In: International Joint Commission's Workshop Proceedings 'Toxicity to Biota of Metal Forms in Natural Water', October 7-8, 1975, Duluth, Minn. p 9-32, April 1976. 2 fig, 3 tab, 60 ref.

Descriptors: *Trace elements, *Heavy metals, *Toxicity, *Molecular structure, International Joint Commission, Great Lakes, Cations, Hardness(Water), Mode of action, Environmental effects, Bonding, Cohesion, Adsorption, Chemical reactions.
Identifiers: Bioaccumulation, Detoxification.

The majority of inorganic compounds exist in the form of ions whose biological activity is a function of their binding to ionizable groups in organic compounds. Strongly bound ions block the ionizable groups and change or inhibit the normal biological functions of organic compounds. Development of binding constants to organic compounds may lead to good correlations; glycine is a good compound for correlations, and binding constants of many cations are available. The indications are that the toxicity (incipient lethal level) is a linear function of hardness and the slopes and intercepts calculated from published data are presented. The recognized toxicity reduction by organic matter may be due to the active sites in organic molecules which bind cations in the form of nontoxic complexes and an equation could be used to describe the effect of organic matter on toxicity. Competition between organic compounds and tissues to bind the toxic cations could also play a role in the toxicity-decreasing effect of organic matter. Water analyses are important for the determination of equilibrium constants which, once known, make it possible to calculate the concentrations of various ionic species and complexes and then could be expressed in 'toxic units.' METAL SPECIATION IN AQUATIC ENVIRONMENTS,
Illinois Inst. of Tech., Chicago. Dept. of Environmental Engineering.
H. E. Allen, M. L. Crosser, and T. D. Brisbin.
In: International Joint Commission's Workshop Proceedings 'Toxicity to Biota of Metal Forms in Natural Water', October 7-8, 1975, Duluth, Minn. p 33-57, April 1976. 7 fig, 21 ref.

Descriptors: *Metals, *Speciation, *Chemical properties, *Toxicity, *Analytical techniques, Ion exchange, Electrophoresis, Chemical reactions, Measurement, Electrochemistry, Equations, Chelation.
Identifiers: *Stability constants.

Measurement of the total metal concentration is insufficient to determine its biological effects as the chemical form of the metal must be known to permit accurate interpretations of both its degree of toxicity and geochemical reactions. Prediction of trace metal levels, their forms and transformations (complexations) requires the development of mechanistic models which are based on equilibrium constants of metal complexes. Recent applications of electroanalytical techniques, such as anodic stripping voltammetry, differential pulse polarography, and differential pulse anodic stripping voltammetry have been applied to the measurement of stability constants. Their applications and results are discussed. Proposed is the use of the ion exchange equilibrium technique for measurement of both stability constants and of complexation capacity; it is also useful in defining the significance of a stability constant in a multiligand system. Application of the ion exchange equilibrium to the study of a complexation in AAP medium used for toxicity studies, complexation of metals in sewage treatment plants, and assessment of the relative significance of ligands entering the aquatic environment from various sources is presented. PHARMACOKINETIC APPROACHES TO THE EVALUATION OF METHYLMERCURY IN FISH,
Michigan Univ., Ann Arbor. Public Health Toxicology Program.
R. Hartung.
In: International Joint Commission's Workshop Proceedings 'Toxicity to Biota of Metal Forms in Natural Water', October 7-8, 1975, Duluth, Minn. p. 233-248. April 1976. 6 fig., 3 tab., 8 ref.

Descriptors: *Mercury, *Fish, *Absorption, *Distribution, *Mathematical models, Persistence, Metabolism, Eels, Piles, Lake trout, Heavy metals.
Identifiers: *Methylmercury, *Mercury bioaccumulation, Methylmercury excretion.

Some of the simpler pharmacokinetic models are applied to existing data for the evaluation of the uptake of methylmercury by fish and its relationship to methylmercury environmental levels. The model cited attempts to duplicate many of the naturally occurring processes by using many compartments and rate constants. The methodology indicates that it is possible to effectively present uptake, storage, and elimination data by relatively simple kinetic equations. The model of uptake and accumulation was tested with several existing data sets and invites additional testing to explore its limitations and possible refinements. Improved precision appears possible, especially if additional information on elimination rate constants could found for the species examined. The estima equilibrium concentration and the theoret bioaccumulation coefficient appear to have sign cant utility in comparing experimental results w one another. The data tested had been compi for pike, eel, and lake trout. Species differen with respect to uptake appear to be less signific than anticipated; however, temperature effe possibly due to metabolic rates, were found to pronounced and systematic. The kinetic analys particularly useful in permitting comparis among bioaccumulation studies and appears have potential for establishing an approach relating experimental data to environmental d (See also W77-01295) (Auen-Wisconsin)

TOXICITY RELATIONSHIPS TO CO FORMS IN NATURAL WATERS,
Environmental Research Lab., Duluth, Minn.
R. W. Andrew.
In: International Joint Commission's Work Proceedings 'Toxicity to Biota of Metal For Natural Water', October 7-8, 1975, Duluth, p. 127-143. April 1976. 4 fig., 5 tab., 22 ref.

scriptors: *Copper, *Toxicity, *Chemical properties, Water chemistry, Minnows, Daphnia, drogen ion concentration, Heavy metals, Solubility, Chelation, Bioassay, Fish, Waterfleas, Conidation.
ntifiers: *Cupric ion, Fathead minnow.

ts with fathead minnows and Daphnia magna nonstrated that copper toxicity is largely a ction of the cupric ion activity and that toxicity iations primarily occur as a result of changes in ic activity either through precipitation or comxation. Copper precipitation as hydroxides, bonates, and/or phosphates results in toxicity uctions. In highly alkaline waters with a imum of soluble complexing or chelating nts, measurements of dissolved copper may e a fair approximation of the biologically active m with attendant reduction in the toxicity varie. LC50 values based on total copper measurents in such situations were totally irreproduci- and have little value even as an indicator of ative toxicity. None of the soluble (dissolved) nplexes or chelated forms, including organic l inorganic complexes and neutral and ionized ms, are appreciably toxic. Toxicity of the pric ion may be modified by interaction with er cations, particularly hydrogen ions. Calcium l magnesium do not appear to be a major factor copper toxicity. Both bicarbonate alkalinity and hophosphate have major roles in limiting pper toxicity; however cupric ion toxic levels n be accurately measured and/or monitored in w-through bioassays. Increasing toxicity of pric ion at high pH is hypothesized to result m interactions with sulfhydryl-containing otc...s or enzymes. (See also W77-01295) (Auensconsin)

International Joint Commission's Workshop oceedings 'Toxicity to Biota of Metal Forms in tural Water', October 7-8, 1975, Duluth, Minn. 59-75, April 1976. 2 tab., 35 ref.

scriptors: *Heavy metals, *Toxicity, peciation, Aquatic animals, Fish, Solubility, sorption, Trace elements, Stability, Suspended ids, Ions, Hydrogen ion concentration, Hardss(Water), Calcium carbonate, Cadmium, pper, Zinc, Consolidation, Chromium, Nickel.
ntifiers: *Toxicology, Synergistic effects, Angonistic effects.

e problems involved in the determination of the xicity of the chemical components of heavy tals, their synergistic/antagonistic effects with ier metal chemials, the pH, water hardness, and spended solids, are discussed. Tests of single bstances and single species (often only acute hal tests) to define 'acceptable' levels are inid determinations of toxic levels particularly der chronic exposure or fluctuating concentrans. When it comes to assessing the effects of riously mixed effluents, it is impossible to fully scribe their chemical components let alone their fects; and even if these effects were identifiable, ir biological effects would still be unpredicta-. Included in this presentation are the types of avy metal contaminations, basic aspects of their xicology to animals (particularly fishes), and me of the work on the toxic aspects of the emical states of copper, cadmium, zinc, chromium, nickel, and their interactions with suspended solids and chelating compounds. One conclusion is that because in hard waters chemical availability of the cupric ion tends to limit toxic concentrations whereas in soft waters it is the physiological aspects of fishes and of the non-specificity of both heavy metals and ligands, it is unlikely that precise definitions of toxic relations are possible. (See also W77-01295) (Auen-Wisconsin).

COPPER TOXICITY TO PHYTOPLANKTON, AS AFFECTED BY ORGANIC LIGANDS, OTHER CATIONS AND INHERENT TOLERANCE OF ALGAE TO COPPER,
Toronto Univ. (Ontario). Inst. for Environmental Studies and Engineering.
P. Stokes, and T. C. Hutchinson.
In: International Joint Commission's Workshop Proceedings 'Toxicity to Biota of Metal Forms in Natural Water', October 7-8, 1975, Duluth, Minn. p. 159-185, April 1976. 14 fig., 3 tab., 26 ref.

Descriptors: *Copper, *Toxicity, *Plant physiology, *Resistance, *Algae, Organic matter, Cations, Heavy metals, Ions, *Canada, Nickel, Chlorella, Scenedesmus, Chelation, Absorption.
Identifiers: Sudbury(Ontario), Metals tolerance.

In addition to the speciation of metal and metal movement through aquatic ecosystems, toxicity is dependent on the physiological processes of the organisms themselves. The effect of the chemistry of a particular metal on an organism is mediated by the effect of pH and cations. The organisms complete with non-living parts of the system as binding sites consequently the actual thresholds of toxicity even for closely related biota vary widely. Field and laboratory studies attempted to relate the toxicity of the form and concentration of heavy metals to algae (Scenedesmus and Chlorella), particularly of 'labile' and 'bound' metals to the relationship between chemical measurements and metal toxicity. The field sites centered around the Sudbury, Ontario, mining and smelting region where some lakes have been recorded to contain 6.4 ppm levels of nickel and 1.0 ppm of copper. Five lakes were selected with varying organic and heavy metal contents, and with a pH higher than 6.0. It was found that copper tolerance has evolved in some of the algae. The major difference in algal response could be accounted for by differences in organic matter and by their relative complexing capacity. The test information generated has little direct application but does have potential for a number of chemical and biological assays for water quality determinations. EFFECTS OF ORGANIC POLLUTANTS ON COPPER TOXICITY TO FISH,
Michigan Univ., Ann Arbor. Dept. of Environmental and Industrial Health.
D. P. Chynoweth, J. A. Black, and K. H. Mancy.
In: International Joint Commission's Workshop Proceedings 'Toxicity to Biota of Metal Forms in Natural Water', October 7-8, 1975, Duluth, Minn. p. 145-157, April 1976. 5 tab., 31 ref. FWPCA 14-12-591.

Guppies were exposed to copper at 50-500 microgram/l concentrations in the presence of various organic ligands in moderately hard water (66.8-98.0 mg/l calcium carbonate) maintained at pH 7.5. The organic compounds were selected on the basis of their prevalence as pollutants or their complexing properties. Glycine, cysteine, EDTA, NTA, and citric acid were added at concentrations of 0.0000036 M. Albumin, humic acid, and secondary sewage effluent were added to give a final concentration of 5 mg/l (as total organic matter). Median lethal copper doses were calculated using log probit analyses of the bioassay data. The relative binding capacities of the organic ligands were determined by anodic stripping voltammetry. The toxicity results were compared to the stability of the copper-organic complexes in the bioassay solutions. Test fish were analyzed by atomic absorption spectrophotometry to determine the amount of copper accumulation in the internal organs. An inverse relationship was observed between the degree of copper binding and copper toxicity. No significant correlation was obtained between organic binding or toxicity and uptake of copper by fish. Unresolved are the effects of alkalinity and hardness on copper toxicity; toxicity of copper complexed with inorganic and organic particulates; toxicity of copper contained in fish food; and sites and mechanisms of copper toxicity. SYMPOSIUM ON STRUCTURE-ACTIVITY CORRELATIONS IN STUDIES OF TOXICITY AND BIOCONCENTRATION WITH AQUATIC ORGANISMS.
International Joint Commission-United States and Canada.
March 11-13, 1975, Canada Center for Inland Waters, Burlington, Ontario. 352 p. G. D. Veith and D. E. Konasewich, editors.

Descriptors: *Chemicals, *Molecular structure, *Toxicity, Sorption, Solubilitv, Organic compounds, Testing, Food chains, Osmosis, Surfactants, Linear alkylate sulfonates, Lethanl limit, Daphnia, Minnows, International Joint Commission, Phenols, Analytical techniques, Bioassay, Fish, Animal pathology, Mode of action, Rainbow trout, Pesticides, Persistence, Measurement, Penetration, Chemical reactions, Solutes, Pollutants, Mathematical models, Correlation analysis, Permits, Standards, Distribution, Pollutant identification.
Identifiers: Bioconcentration, Toxic units, Combined toxicants, Synergism, Antagonism, Multivariate analysis, Partition coefficients, Depuration, Biological half-life, Sub-lethal effects, Toxicology.

The contributions centered on the structure of chemicals as they relate to toxicity and biomagnification/bioaccumulation with the underlying thrust of further research requirements. Papers discussed the structure-activity relationships in toxicology of fish and Daphnia; surfactant, phenolic compounds, and DDT analogs and their toxicity, uptake, depuration; and intertissue movement of hydrophilic, amphiphilic, and hydrophobic compounds as related to fat solubility. Presentations discussed the use of the n-octanol/water partition coefficient in predicting the bioconcentration potential of organic chemicals, and its use in the evaluation of the relative hazards of various chemicals. Other papers related to the comparison of analytical methods in the relationship between chemical and biological properties of chemicals; utilization of available environmental data for toxicity studies; the study of multiple toxicity; and mathematical models for the time/space distribution of chemicals in water. Also, details are given for a permit system to control chemical pollution based on a toxicity index. A panel discussion followed the presentations, generating the conclusions that structure-activity correlations can be successfully applied to toxicity testing by using the n-octanol/water partition coefficient, the Hammet sigma constant, the field and resonance constants and the pK. The correlations can be applied to structurally related chemicals exhibiting the same mode of action and the same biological endpoint. The correlations are not likely to predict the toxicity of complex effluents. The chemical uptake rates significantly affect the death rate in acute toxicity tests. PREDICTING A BIOCONCENTRATION POTENTIAL OF ORGANIC CHEMICALS IN FISH FROM PARTITION COEFFICIENTS,
Dow Chemical Co., Midland, Mich.
D. R. Branson, W. B. Neely, and G. E. Blau.
In: International Joint Commission Symposium on 'Structure-Activity Correlations in Studies of Toxicity and Bioconcentration with Aquatic Organisms,' March 11-13, 1975, Canada Center for Inland Waters, Burlington, Ontario, p 99-118. 2 fig, 5 tab, 13 ref.

Descriptors: *Chemicals, *Absorption, *Measurement, Food chains, Rainbow trout, Organic compounds, Toxicity, Osmosis.
Identifiers: *Bioconcentration, Partition coefficient.

The ratio of the equilibrium concentration of a chemical between a nonpolar and polar solvent (in this instance n-octanol and water), i.e., the partition coefficient, was used to examine the relationship between the physiochemical properties of chemicals and their ability to bioconcentrate. The chemicals with a wide range of partition coefficients, included 1,1,2,2-tetrachloroethylene, hexachlorobenzene, 2,2',4,4'-tetrachlorobiphenyl, 2-biphenyl phenyl ether, diphenyl ether, carbon tetrachloride, and p-dichlorobenze. The relationship was established by measuring the bioconcentration (the ratio of the concentration of the chemical between trout muscle and the exposure water measured at equilibrium) in trout. The following equation of the straight line can best be used to predict the bioconcentration of chemicals from their partition coefficients: Log (Bioconcentration factor) = 0.542 Log (Partition coefficient) + 0.124. The predicted values for biomagnification apply to a specific test procedure and have been used primarily to compare various new chemicals. In interpreting the bioconcentration factor for any chemical it must be remembered that metabolism for the agent may be a very active process, consequently the total amount of material in the ecosystem is constantly being reduced while the ratio between the fish and the environment will remain relatively fixed. STRUCTURE-ACTIVITY RELATIONSHIPS IN FISH TOXICOLOGY,
Fisheries and Marine Service, St. Andrews (New Brunswick). Biological Station.
V. Zitko.
In: International Joint Commission Symposium on 'Structure-Activity Correlations in Studies of Toxicity and Bioconcentration with Aquatic Organisms,' March 11-13, 1975, Canada Center for Inland Waters, Burlington, Ontario, p 7-24. 25 ref.

Descriptors: *Toxicity, *Chemicals, *Molecular structure, *Testing, Solubility, Organic compounds, Aquatic animals, Fish, Sorption, Food chains, Osmosis.
Identifiers: Bioconcentration, Hansch method, Toxicology.

A review of the quantitative relationships between the chemical structure and properties of organic molecules, and biological activity indicates that these relationships are a useful tool in aquatic toxicology. Correlations between the hydrophobic (lipophilic) character of small, mostly electrically neutral molecules, and their toxicity to aquatic fauna are available and are shown as equations. While substituted salicylanilides are probably the largest group of related compounds examined for fish toxicity, the data have not been quantitatively valuated in terms of free-energy related constants. The availability of numerous chlorobiphenyls makes them an attractive group for structure-activity correlation although fish metabolize most chlorobiphenyls very slowly, if at all. Aromatic and aliphatic hydrocarbons are also suitable for structure-activity correlations, as fish metabolize these compounds and shellfish accumulate them. Logically, compounds above a certain molecular weight will not be taken up by aquatic animals, but it would be of interest to determine if any generalizations on uptake-molecular weight relationships can be made. Also low water solubility compounds may not be available to fauna and this area is another subject for investigation. Determination of structure-activity relationships will supply answers about environmental effects of organic compounds but their major limitation is the choice of appropriate types of biological activity. STRUCTURE-ACTIVITY RELATIONSHIPS APPLIED,
Minnesota Univ., Duluth. Dept. of Chemistry.
R. M. Carlson, H. L. Kopperman, R. Caple, and R. E. Carlson.
In: International Joint Commission Symposium on 'Structure-Activity Correlations in Studies of Toxicity and Bioconcentration with Aquatic Organisms,' March 11-13, 1975, Canada Center for Inland Waters, Burlington, Ontario, p 57-72. 2 fig, 3 tab, 32 ref. 18050 Hik and R800675.

Descriptors: *Toxicity, *Phenols, *Analytical techniques, Daphnia, Lethal limit, Chromatography, Solubility, Sorption, Food chains, Osmosis.
Identifiers: Partition coefficient, Hansch method, Bioconcentration.

A correlation showing the dependency of the observed lethal limit-50 of a series of phenols to the free energy related terms, pi, field and resonance (F and R), has been observed for the freshwater invertebrate, Daphnia magna. A series of 14 phenols was investigated with the best correlation obtained with F and R considered to be additive terms, as shown in the following equation: Log 1/c = 0.500pi plus 0.453F plus 0.63R plus 3.73. r = 0.978. Moreover, the dominant parameter was found to be the partition coefficient, represented by the equation: Log 1/c = 0.527pi plus 3.796 r = 0.831. The implications of these results to toxicity and bioaccumulation has led to the development of a method using a permanently bonded long chain alkyl packing in a high pressure liquid chromatographic system and subsequently relating the capacity factor—the net retention time relative to the nonadsorbed time—to the partition coefficient. STRUCTURE-ACTIVITY RELATIONSHIPS OF DDT ANALOGS IN A NON-TARGET ORGANISM. LETHAL AND SUBLETHAL EFFECTS OF BROOK TROUT FINGERLINGS,
Carleton Univ., Ottawa (Ontario). Dept. of Biology.
D. R. Gardner.
In: International Joint Commission Symposium on 'Structure-Activity Correlations in Studies of Toxicity and Bioconcentration with Aquatic Organisms,' March 11-13, 1975, Canada Center for Inland Waters, Burlington, Ontario, p. 77-97. 8 fig., 18 ref.

Descriptors: *Chemicals, *Molecular structure, *Toxicity, *Mode of action, Lethal limit, Bioassay, Fish, Environmental effects, Animal pathology.
Identifiers: Sub-lethal effects.

The problems of determination of the mechanis and/or site of action of a particular chemical co pound by comparison of in vitro and in vi molecular requirements for toxicity, to provi data on receptor site specificity, and prediction the toxicity of compounds by examination of the molecular structure and properties are discusse The experimental design attempted to define wh biological parameters should be considered f structure-activity relationships, what can be e amined with any degree of accuracy, what si nificance do chosen parameters have to the su vival of the whole animal, how to relate an in vit approach to in vivo, how to confront the biologic material with known concentrations of a co pound, and, finally how to assess the significan of the effects of compounds at sublethal dos The examination centered on the effect of t DDT analogs on brook trout fingerlings, i.e., t relationship between a molecule of known pes cide properties and a nontarget organism, usi their response to temperature gradients. The co clusions underscore the necessity for choosing a propriate biological parameters as measures structure-activity relationships. Also the necessi for considering that the sublethal effect on tar and on non-target organisms, or non-toxic co pounds, might eventually produce a delayed m tality. STATISTICAL PROPERTIES OF ENVIRO MENTAL DATA: CONSIDERATIONS FO BIOACCUMULATION AND TOXICITY ST DIES OF POLLUTANTS,
Illinois State Environmental Protection Agenc Springfield.
D. J. Schaeffer, and K. G. Janardan.
In: International Joint Commission Symposium 'Structure-Activity Correlations in Studies of To icity and Bioconcentration with Aquatic Orga isms,' March 11-13, 1975, Canada Center for land Waters, Burlington, Ontario, p. 177-194 fig., 2 tab., 22 ref.

Descriptors: *Pollutants, *Toxici *Mathematical models, *Data collections, Stati cal methods, Analytical techniques, Food chai Correlation analysis.
Identifiers: *Bioconcentration, Data analys Multivariate analysis.

The usage of existing environmental data in tox ty studies and some statistical properties of su data are examined, and a technique is descri for estimating the relative magnitudes of analyti laboratory and sampling errors. In many instanc these estimates are more than adequate for dev ing better collection programs; at the very le they provide a priori information estimates wh can be used in Bayesian statistical analyses to o tain precise posterior estimates. The evaluation the significance of data must include the valid of experimental protocol, the reliability of tests used to make the measurements, the qua of the answers obtained from the data analysis their relation to the original questions, and the s nificance of the conclusions. The point made that the establishment of structure-activity re tionships does not necessarily indicate that molecular properties and the toxic responses related by a cause and effect relationship to th parameters, but only that these parameters hav high degree of usefulness in the mathematical c crimination of these properties as they pertain t data set. The Murkov-Polya Urn Models theory applied to the development of a model of po tant-induced stress on biological communit (See also W77-01310) (Auen-Wisconsin)

rationale for models to predict the toxicity of xtures through the derivation and use of quantal l or none) response curves of the toxic con-tuents is proposed. The rationale assumes three ncipal categories of toxic action between dis-te chemical constituents of a mixture, i.e., inde-ndent action, additive action, and interaction nergism and antagonism). Independent action is edictable on the axiom that the kinetic and namic mechanisms of each toxic element are ique and are not influenced by any other chemi-l components in the mixture. The additive action predictable on the assumption that the dynamic echanism is common to or similar for all toxic nstituents; individual toxic components may ffer in their relative potencies or efficacies but t identically on the target tissue. Consequently e quantal response curves for each constituent well as their corresponding mixture should be rallel. The interaction of toxic mixtures assumes at the kinetics and/or dynamics of a toxic con-tuent are altered in the presence of another toxi-nt, and the relative potency of a toxicant may be her enhanced or lessened in the mixture. The agnitude of the response to a mixture in which e components interact is dependent on the rela-e proportions of the constituents rather than on eir inherent potencies. perimental results of the propensity of over 50 4 labeled pesticides to accumulate in bluegill, oconcentration factors, and measures of the hes depuration upon transfer to uncontaminated ter are presented. These data are compared to nilar parameters generated for certain chemicals nerally considered hazardous to aquatic osystems. A number of general observations ating to the time to establish equilibrium, the bioconcentration factor obtained, the estimated biological half-life, and the effect of the pesticide concentration on these parameters are summarized. For a great majority of the labeled pesticides, an equilibrium was reached in less than three weeks and for most pesticides, the chemical residues in the muscle of bluegill are relative short-lived provided contamination is not continuous or the exposure prolonged. Biological half-life of more than two-thirds of the labeled pesticides was less than seven days. A model ecosystem approach was also utilized for a more realistic assessment of the potential hazard for food chain contamination. The bioconcentration of 14C-residues in bluegill exposed to the same herbicide in both the fish-water system and the model ecosystem differed dramatically; this was primarily due to conversion during the aging period in the model system of the parent 14C-herbicide to 14C-degradation products with much lower propensities to accumulate and persist. CALCULATION OF PARTITION COEFFICIENTS USEFUL IN THE EVALUATION OF THE RELATIVE HAZARDS OF VARIOUS CHEMICALS IN THE ENVIRONMENT,
Pomona Coll. Claremont, Calif. Dept. of Chemistry.
A. J. Leo.
In: International Joint Commission Symposium on 'Structure-Activity Correlations in Studies of Toxicity and Bioconcentration with Aquatic Organisms,' March 11-13, 1975, Canada Center for Inland Waters, Burlington, Ontario, p. 151-176. 15 fig.

Descriptors: *Chemicals, *Toxicity, *Measurement, Solubility, Molecular structure, Penetration, Chemical reactions, Solutes, Osmosis.
Identifiers: *Partition coefficients.

The partition coefficient, P, measures the energy involved in transferring a molecule of a solute from water to a non-polar solvent and is an essential parameter in the study of the effect of potentially toxic chemicals in water. The distribution of a solute between immiscible solvents--water and octanol--can be treated as though it results from three primary factors: (1) the energy required for 'hole' formation, (2) the solute-solvent interaction from permanent bond dipoles; and, (3) the solute-solvent interaction from hydrogen bonds. As these three factors operate in both octanol and water, thus it is the sum of the relative effect which determine the equilibrium between phases, i.e., the partition coefficient. Not only is the bioaccumulation factor related to the log P of the chemical, but frequently its activity within the organisms--disruption of key enzymatic processes or its metabolic fate--is log P dependent. When a high degree of confidence can be overlooked, calculated log Ps can serve very well if developed from measured values for molecular structures which contain the important 'interactive' fragments. The theoretical basis for such calculations and the significance of the differences in values from various lipid solvent systems are discussed and illustrated. (See also W77-01310) (Auen-Wisconsin)

A PRELIMINARY TROPHIC STATUS CLASSIFICATION OF SOME SOUTH AFRICAN IMPOUNDMENTS,
National Inst. for Water Research, Pretoria (South Africa).
D. F. Toerien, K. L. Hyman, and M. J. Bruwer.
Water SA., Vol 1 (1), p 15-23, (1975). 3 fig, 4 tab, 11 ref.

Descriptors: Water quality, Bioassay, *Algae, Nutrients, Nitrogen fixation, *Eutrophication, Phosphorus, Impoundments, Africa, *Trophic level, Classification, Algal control.
Identifiers: *South Africa, Limiting nutrients, *Algal growth.

A preliminary trophic status classification of 98 major South African impoundments was constructed using agal bioassay procedures to determine the algal growth potential and to identify the growth limiting nutrients in each impoundment. The classification procedure embodied a technique whereby the growth potential of nitrogen fixing algae was accounted for. Phosphorus was the most frequent algal growth limiting nutrient in non-eutrophied impoundments and nitrogen the most frequent in highly eutrophied ones. Because of the fixation of atmospheric nitrogen by certain blue-green algae, the control of nitrogen appears to have limited value in eutrophication control. Limiting the access of phosphorus to impoundments seems to offer a long-term solution to eutrophication problems. Urban-industrial development, giving rise to nutrient rich effluents, seems to be the major cause of eutrophication although the role of agriculture can not be negated. (South Africa)
W77-01363

THE EUTROPHICATION LEVELS OF SOME SOUTH AFRICAN IMPOUNDMENTS. 1. RIETVLEI DAM,
National Inst. for Water Research, Pretoria (South Africa).
D. J. Steyn, W. E. Scott, D. F. Toerien, and J. H. Visser.
Water SA, Vol 1 (2), p 45-52, (1975). 9 fig, 4 tab, 12 ref.

Descriptors: Water pollution effects, *Bioassay, Sewage effluents, Phosphorus, Algae, Seasonal, Nutrients, *Eutrophication, Pollutant identification, Impoundments, Africa.
Identifiers: *Rietvlei Dam(South Africa), Limiting nutrients.

Algal bioassay results show Rietvlei Dam to be in a highly eutrophied state. The growth of non-nitrogen-fixing algae is limited by nitrogen, and that of nitrogen-fixing algae by phosphorus. It is predicted that increased discharge of sewage works effluent will increase the eutrophication status of the dam, but an inflow with lower nutrient concentrations will reduce it. The results suggest that the control of phosphorus rather than nitrogen inputs must be considered for eutrophication control, but a more complete understanding of the chemical, physical and biological characteristics of the impoundment is required before a decision can be made as to the best methods of eutrophication control. EUTROPHICATION LEVELS OF SOME SOUTH AFRICAN IMPOUNDMENTS. II. HARTBEESPOORT DAM,
National Inst. for Water Research, Pretoria (South Africa).
D. J. Steyn, D. F. Toerien, and J. H. Visser.
Water S. A. Vol. 1 (3), p 93-101 (1975). 7 fig, 3 tab, 22 ref.

Descriptors: *Eutrophication, *Bioassay, Nutrients, Nitrogen, Phosphorus, Sewage effluents, Algae, Dams, Impoundments, Africa, Water pollution effects, Pollutant identification.
Identifiers: *South Africa, *Hartbeespoort Dam(So Africa), Limiting nitrients.

Algas bioassays indicated that Hartbeespoort Dam is highly eutrophied because algal growth poten-

tials (AGP) of more than 100 mg l-1 and batch culture algal growth rates of 2, 1 d-1 were recorded. Nitrogen was the primary and phosphorus the secondary growth-limiting nutrient. Addition of secondary sewage effluents linearly increased the AGP at rates of between 7,7 and 13,0 mg l-1 per cent (v/v) effluent added. These increases could be attributed to an increase in the nitrogen content of the water by the effluent. Addition of sewage effluents did not change the identity of nitrogen as the primary growth-limiting nutrient. Dilution with water of a low nutrient content linearly decreased the AGP. Although nitrogen at present determines the magnitude of algal blooms in the dam, phosphorus control is advocated for the control of eutrophication problems in the dam. ACTION OF THREE PRESUMABLY ETOCRINE SUBSTANCES (RIBOFLAVIN, GLUTAMIC ACID, GLYCINE) ON THE KINETICS OF EGG DEVELOPMENT AND LARVAL GROWTH IN TWO SPECIES OF ECHINOIDS, ARBACA LIXULA AND PARACENTROTUS LIVIDUS). ACTION DE TROIS SUBSTANCES SUPPOSEES ECTOCRINES (RIBOFLAVINE, ACIDE GLUTAMIQUE, GLYCINE) SUR LA CINETIQUE DU DEVELOPPEMENT DE L'OUEF ET AL ROISSANCE DE LA LARVE DE DEUX ESPECES D'ECHIINIDES, ARBACIA LIXULA ET PARACENTROTUS LIVIDUS,
Institut Oceanographique, Paris (France).
J. F. Pacillon.
Marine Biology, Vol. 34, p. 67-75, 1976. 1 tab., 5 fig., 16 ref.

Descriptors: *Inhibitors, Mode of Action, *Immature growth stage, *Growth rates, *Amino acids, Larvae, *Larval growth stage, Kinetics, Biochemistry, *Vitamins, *Nutrients, Enzymes, Animal physiology, Vitamin B, Laboratory tests.
Identifiers: Riboflavin, Glutamic acid, Glycine, *Arbacia lixula, *Paracentrotus(Lividus), Echinoids, Etocrine substances.

The kinetics of egg development and larval growth of the 48-hr Arbacia lixula pluteus and Paracentrotus lividus were compared in sea water and in media containing concentrations of riboflavin, glutamic acid and glycine from 0.1 microgram/l to 50 mg/l. Glutamic acid and glycine appear to significantly effect both egg and larval development and riboflavin appears to effect development in the egg only. Dissolved amino-acids tested at natural concentrations interfere in protein synthesis according to the degree of maturity of the eggs and the species. This action modifies the kinetics of the development of the egg and larval growth. Riboflavin appears to stimulate enzyme action which has no deleterious effect on pluteus growth. In high concentrations, the amino-acids could act as chelates indirectly stimulating the growth of the larva. (Katz)

EFFECT OF SOME PESTICIDES ON THE ABILITY OF THE FILTERATION OF EEL CULTURE USING RECIRCULATING FILTER SYSTEM, (IN KOREAN),
Pusan Fisheries Coll. (Republic of Korea).
I.-B. Kim, and M. J. Park.
Bull Korean Fish Soc. 7(4), p 187-194, 1974.

Descriptors: *Pesticides, *Fish diseases, Control, *Cultural control, *Filters, Eels, Water pollution effects.
Identifiers: Formalin, Malachite green, Dipterex, Furanace.

When rearing fish in recirculating filter systems, some pesticides are often used for controlling various fish diseases. The pesticides are usually applied after stopping the filtration, to avoid affecting the filtering ability to bacteria in the filter system. The influence of 3 pesticide treatments: formalin, 33 ppm plus malachite green, 0.15 ppm; Dipterwx, 0.25 ppm; and furanace, 0.1 ppm, on filtering ability, expressed as the consumption rate of dissolved O2 and depletion of NH3-N during passage through the filter layer was investigated. These pesticides did not affect filtering ability.--Copyright 1975, Biological Abstracts, Inc.

LTURE STUDIES ON THE EFFECTS FROM RATE POLLUTION ON THE GROWTH OF RINE PHYTOPLANKTERS,
heries and Marine Service, Vancouver (British lumbia). Vancouver Lab.
N. J. Antia, and J. Y. Cheng.
Journal of the Fisheries Research Board of Canada, Vol. 32, p. 2487-2494, 1975, 2 fig., 4 tab., 25 ref.

Descriptors: Environmental effects, *Phytoplankton, Water pollution sources, Water pollution effects, *Lethal limit, *Toxicity, *Bioassay, Population, *Algae, *Pulp wastes, *Adaptation, Laboratory tests, Water quality, Industrial wastes, Primary productivity.
Identifiers: *Borate, *Boric acid.

The autotrophic growth of 19 species of marine phytoplankters, from 10 classes of algae, was tested on axenic cultures with boric acid additions of 0-100 mg/liter B to a controlled seawater medium. Growth inhibition occurred in 26 percent of the species at 50 mg/liter B and in 63 percent of species at 100 mg/liter B. Both adaptation period and degree of inhibition lessened on sequential transfer of certain species from lower to higher boron concentration. These results predict that, in the absence of stress from nutrient deficiency and adverse pH conditions, inorganic borate pollution would be tolerated by phytoplankton up to 10 mg/l B while concentrations up to 100 mg mg/l B would cause species redistribution. (Katz)
W77-01506

TOXICITY OF 30-MINUTE EXPOSURES OF RESIDUAL CHLORINE TO THE COPEPODS LIMNOCALANUS MACRURUS AND CYCLOPS BICUSPIDATUS THOMASI,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
D. L. Latimer, A. S. Brooks, and A. M. Beeton.

Identifiers: *Limnocalanus spp., *Cyclops spp.

Laboratory bioassays were conducted at 5, 10, 15 and 20 C to determine the toxicity of residual chlorine, as might be found in power plant cooling waters, to two copepods. The 30-minute TL50 was 1.54 mg/l for Limnocalanus macrurus at 5 and 10 C. For Cyclops bicuspidatus thomasi, the 30-minute TL50 values at 10, 15 and 20 C were 14.68, 15.61 and 5.76 mg/l, respectively. Predicted safe concentrations, using 5 percent mortality for 30-minute exposures were 0.9 mg/l for L. macrurus and 0.5 mg/l for C.b. thomasi. These concentrations roughly coincide with the maximal chlorine levels characteristic of most power plant effluents. (Katz)

THE EFFECT OF THE PRELIMINARY ADAPTATION TEMPERATURE ON THE DISTRIBUTION OF JUVENILE COD (GADUS MORHVA) AND POLLOCK (POLLACHIUS VIRENS) WITHIN A TEMPERATURE GRADIENT,
Murmanskii Morskoi Biologicheskii Institut (USSR).
Y. V. Tat'yankin.
Journal of Ichthyology (English Translation) Vol. 14, No. 5, 1975, p 755-760, 2 fig, 3 tab, 16 ref. Translated from Russian.

Descriptors: *Environmental effects, *Adaptation, *Temperature, Fish, Laboratory investigations, Juvenile fish, *Distribution, Water pollution effects.
Identifiers: *Cod, *Pollock, Gadus morhua morhua, Pollachius virens.

The study was conducted in the years 1967-1969 on cod and pollock underyearlings in August-September and on yearlings and 2 year old fish in January-February. The temperature was altered by approximately 8 C so that the fish were exposed to winter temperatures in the summer and to summer temperatures in the winter. The temperatures selected by the fish under temperature gradient conditions were dependent on the temperature of the preliminary adaptation with the zones of selected temperatures being in the same direction as the action of the adaptation temperature. Dependence on the temperature of preliminary adaptation was related to the specific and age characteristics of the fish. The adaptation process is completed most rapidly in older cod by comparison with younger pollock and cod of the same age. Adaptation was more rapid to high than to low temperatures. (Chilton-ORNL)

LARVAL CONTRACAECUM (NEMATODA, ANISKIDAE) IN THE PERICARDIUM OF FISHES FROM EAST AFRICAN LAKES,
Hebrew Univ., Jerusalem (Israel). Heinz Steinitz Marine Biology Lab.
I. Paperna.
Proc Helminthol Soc Wash. 41(2), p 252, 1974.

Descriptors: *Fish parasites, *Worms, Nematodes, Africa, Lakes, *Tilapia.
Identifiers: *Anisakidae, Bagrus-docmac, Contracaecum, Haplochromis-spp., *Lake George, Tilapia-nilotica, *Lake Victoria.

Contracaecum worms were found in the pericardial cavity of Tilapia nilotica (in 35% of 78 fish) and in Haplochromis spp. from Lake George (in 0.4% of 487 fish) and N. Lake Victoria (in 1% of 184 fish), and in Bagrus docmac from Lake George (in 2% of 47 fish). Anatomical characteristics of the worms are described. Usually, only 1 worm was found per infected fish. None of the infected T. nilotica showed signs of emaciation, but some Haplochromis were emaciated.--Copyright 1975, Biological Abstracts, Inc.

ENVIRONMENTAL POISONS.
Svenska Naturskyddsforeningen: Stockholm, Sweden. 1974. 32 p, Landell, Nils-Erik (Ed.).

Descriptors: *Industrial wastes, *Pesticide toxicity, *Law enforcement, *Regulation, *Herbicides, *Pesticides, *Insecticides, *Water pollution sources, *Fish, *Wildlife, *Poisons, Metals, DDT, DDD, Aldrin, Dieldrin, Polychlorinated biphenyls, Fungicides, Seed treatment, Mercury, Plankton.

Identifiers: Malathion, Parathion, Pyrethrum, Sweden, Food concentrations, Methylmercury, Phenylmercury.

The damaging effect of modern industrial poisons (biocides) is reviewed in light of the present laws in Sweden regarding DDT, DDD, polychlorinated biphenyls, aldrin, dieldrin, herbicides, phosphate insecticides (parathion, malathion, etc.), and pyrethrum. The accumulation of DDT, DDD and polychlorinated biphenyls in the food cycle of plankton, fish and mammals is discussed. In Sweden, the use of methylmercury as a seed disinfectant from 1940-1966 and the use of phenylmercury by the forest products industries proved particularly destructive to birds and produced a high Hg content in fish. Tolerable food concentrations of biocides and metals and the concentrations actually found in human organs and in animals, birds and fish are given. In Sweden, 4000 tons of biocides are used yearly, 75-80% herbicides, 6-8% insecticides and the rest fungicides. The State Nature Protection Department has supervised the production of biocides and their use since July 1973. The State Food Authorities also take part. A summary of study material on the damaging effects of biocides provided by the Swedish Society for the Protection of Nature and a bibliography conclude the booklet.—Copyright 1975, Biological Abstracts, Inc.

A FEASIBILITY/DEVELOPMENT STUDY FOR THE REMOVAL OF AMMONIA FROM WASTEWATER USING BIOLOGICALLY REGENERATED CLINOPTILOTITE,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
M. J. Semmens.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-260 512, Price codes: A08 in paper copy, A01 in microfiche. Research Report No. 115, Illinois Water Resources Center, Urbana, August 1976. 141 p, 49 fig, 8 tab, 62 ref. OWRT A-080-ILL(1), 14-31-0001-6014.

Descriptors: *Waste water treatment, *Nitrification, *Ion exchange, *Heavy metals, Biological treatment, Nitrogen, Salts, Toxicity, Recycling, Nitrogen fixing bacteria, Barium, Lead, Copper, Cadmium, Zinc, Costs.
Identifiers: *Ammonia removal, *Regeneration, *Clinoptilotite, Ammonium nitrogen.

Ammonium nitrogen may be readily removed from wastewaters by means of an ammonium selective ion exchanger, clinotpilolite. The major cost in this process is the cost of regenerating the exchanger in order that it may be reused. Results are presented of a study to develop a process in which nitrifying bacteria were employed to regenerate the exchanger. The biological regeneration process is shown feasible in both batch and column studies. The mechanism of regeneration was ion exchange followed by nitrification of the liberated ammonium. The influences of salt concentration, salt composition, particle size, dissolved oxygen, aeration tank configuration, and aeration tank size on the rate of regeneration were identified. The selectivity of clinoptilolite for barium, lead, copper, cadmium and zinc was measured in exchange for sodium. To further identify possible toxic effects of heavy metals toxicity studies were conducted with free and complexed copper.

A SOLUTION PROCEDURE FOR THE DESIGN PROBLEM OF A MULTIPLE TREATMENT PLANT SYSTEM ALONG A STREAM,
McGill Univ., Montreal (Quebec). Dept. of Civil Engineering and Applied Mechanics.
D. Panagiotakopoulos.
Working Paper, UESE 76-12, Department of Civil Engineering and Applied Mechanics, McGill University, Montreal, Canada, May 1976. 5 fig, 5 tab, 10 ref.

Descriptors: *Liquid wastes, *Treatment facilities, *Methodology, *Linear programming, Optimization, Dynamic programming, Decision making, Networks, Streams, Efficiencies, Operations, Dissolved oxygen, Standards, Hudson River, Constraints, Mathematical models, Systems analysis, Equations, *Design, Criteria.
Identifiers: *Cost minimization.

The design problem of liquid waste treatment plants in a multiplant system along a stream entails the selection of a sequence of unit operations for each plant, as well as the determination of each operation's waste removing efficiency, so that the dissolved oxygen standards along the stream are met at minimum cost. The suggested solutions have so far been partial and suboptimal since they consider only the efficiencies on a fixed sequence of unit operations, neglecting the question of choice among them. This paper outlines an efficient two-phase procedure for completely solving this multi-plant system problem by determining for each plant both the best set of operations and their efficiences. First, a network algorithm is developed for generating concave cost-efficiency curves for each plant such that each plant efficiency level corresponds to the optimal rather than to a pre-specified fixed sequence of operations. Second, a linear programming model with concave and separable objective function is employed for allocating treatment requirements among the plants. The procedure is compared with existing ones through an application to a real case. (Bell-Cornell)

APPARATUS FOR TREATING LIQUIDS,
Uddeholms A. B., Hagfors (Sweden). (Assignee).
B. H. Nilsson.
U. S. Patent No. 3,968,038, 7 p fig, 6 ref; Official Gazette of the United States Patent Office, Vol 938, No 1, p 249, July 6, 1976.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial wastes, Water pollution control, Water quality control, Filtration, Filters, Resins, Ion exchange, Water purification, Pulp and paper industry, Equipment.

The apparatus was developed primarily for use in connection with purifying waste-water from woodpulp and paper mills. Purification of wastewater by passing the water through a particulate bed in a column or tank is usually carried out cyclically, with purification phases alternating with phases in which the bed is backwashed so as to be regenerated or cleansed from the captured impurities. on changing over to the purification phase from the backwash phase a 'tail effect' occurs, resulting in pollution of the purified water by impurities from the preceding backwash phas remaining in the liquid collecting and distributi compartment in the tank bottom structure. This la or slow response of the apparatus and the resulti 'tail effect' are proportional to the volume of t tank bottom compartment. The object of this i vention is to reduce the tail effect by providing tank bottom structure that has a small volume. Th liquid treating apparatus is provided with a tank which the bottom structure is comprised of upp and lower bottom plates which are perforated a define between them the bottom compartme which is connected with the filter bed throu openings in the upper bottom plate. The liqu withdrawal or supply pipes are through openin in the lower bottom plate. The apparatus has e cellent strength and the volume of the botto compartment can be substantially reduced witho consequent reduction of the capability of the b tom structure to support heavy beds. (Sinh OEIS)

METHOD AND APPARATUS FOR THE PURI CATION OF A LIQUID CONTAMINATI WITH RADIOACTIVE SUBSTANCES,
Luwa A. G., Zurich (Switzerland). (Assignee).
H. Mende.
U.S. Patent No. 3,969,194, 8 p, 7 fig, 4 ref; Offic Gazette of the United States Patent Office, V 948, No 2, p 641, July 13, 1976.

Descriptors: *Patents, *Waste water treatme *Radioactive wastes, *Water pollution sourc *Water purification, Water pollution treatme Evaporation, Mixing.
Identifiers: Washing.

A method of and apparatus for the purification a liquid contaminated with radioactive substanc is described. The liquid is infed to an evaporator or with which there is connected a column hav a multiplicity of superposed plates or floors. T vapor generated in the evaporator is guid through a washing or scrubbing liquid uniform distributed at the floors and flowing in crossw counterflow with regard to the vapor. The wash liquid at the floors is deflected a number of tim in such a manner that the washing liquid itself together with the droplets entrained by the va is uniformly admixed and the washing liquid s jected to a constant intake of the radioactive s stance. EAVY METAL ADSORBENT PROCESS,
ency of Industrial Science and Technology, kyo (Japan). (Assignee).
Terajima, S. Tomita, Y. Matsuda, and K. Abe.
S. Patent No. 3,970,553, 4 p, 3 tab, 3 ref; Offi-l Gazette of the United States Patent Office, l 948, No 3, p 1100, July 20, 1976.

escriptors: *Patents, *Waste water treatment, ndustrial wastes, *Heavy metals, *Water pollu-n treatment, Water pollution sources, Water llution control, Adsorption.
entifiers: Nitrohumic acid.

trohumic acid exhibits high adsorptivity for avy metals dissolved in water and is easily enerated by the action of an acid. However, s compound is low in mechanical strength when aped into granules. An object of this invention is provide a method of using a heavy metal adsor-nt composed predominantly of nitrohumic acid, ich is insoluble with high mechanical strength. e heavy metal adsorbent can be prepared by the lowing method. Nitrohumic acid is mixed with the carboxyl group-containing polymeric compound and the mixture is kneaded with an aqueous solution of alkali. The kneaded mixture can be first shaped into granules in a conventional manner and then subjected to an acid treatment for insolubilization, or, alternatively, first subjected to an acid treatment for insolubilization and then shaped into granules. When the heavy metal adsorbent of this invention is brought into contact with an aqueous solution containing heavy metals by a suitable means, the adsorbent adsorbs the heavy metals thus serving to eliminate heavy metals effectively from industrial effluent. The adsorbent thus used can easily be regenerated by washing with a solution of a strong mineral acid such as hydrochloric acid or sulfuric acid. (Sinha-OEIS)
W77-01226

PROCESS FOR DETOXIFICATION OF CYANIDES AND NITRILES WITH PEROXYGEN COMPOUNDS,
Deutsche Gold- und Silber-Scheideanstalt A. G., Frankfurt-am-Main (West Germany). (Assignee)
J. Fischer, H. Knorre, and G. Pohl.
U.S. Patent No. 3,970,554, 7 p 8 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 948, No 3, p 1100, July 20, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Chemical wastes, Water pollution sources, *Water pollution treatment, Water pollution control, Water purification, Chemical reactions, Electrochemistry, Oxidation, Electrodes, Catalysts.
Identifiers: *Cyanides, Hydrogen peroxide, *Nitriles.

Waste water containing cyanides, Cyanohydrins and/or organic nitriles are detoxified by adding a peroxide compound in the presence of iodide ion or free iodine, in a given case in the presence of silver ions. Through these additions not only is the reaction considerably accelerated but it is also possible to follow and regulate the reaction potentiometrically, namely, with the help of a silver electrode and a calomel or thalamide electrode as reference electrode. The end of the detoxification reaction is indicated by a clear potential jump over several hundred millivolts which also can be used as the signal for the regulation of the hydrogen peroxide addition. Since the operation is carried out with an excess of iodide over silver, the silver is quantitatively separated from the solution as difficulty soluble silver iodide after the detoxification reaction and can recovered, reprocessed and added again. Excess iodine does not disturb the subsequent biological clarification of the waste waters, but catalyzes the breakdown. (Sinha-OEIS)
W77-01227

CONDITIONING HIGHLY RADIOACTIVE SOLIDIFIED WASTE,
Gesellshaft fuer Kernforschung m.b.H., Karlsruhe (West Germany).
W. Hild, H. Krause, K. Scheffler, H. Gusten, and E. Gilbert.
U.S. Patent No. 3,971,717, 7 p, 5 ref; Official Gazette of the United States Patent Office, Vol 948, No 4, p 1509, July 27, 1976.

Descriptors: *Patents, *Waste water treatment, *Radioactive wastes, *Radioactive waste disposal, Radioactivity effects, Water pollution treatment, Water pollution control, Water purification, Radiation, Cooling.

Highly radioactive wastes, such as fission-product solutions resulting from processing irradiated nuclear fuels, are converted to solid, stable and substantially water-insoluble products before they are transported to a final storage location in conformance with environmental protection requirements. Highly radioactive solidified waste, incorporated in molded bodies of glass, ceramic or a basaltic mass, is introduced into waste water and/or settling or precipitated sludge from community or industrial systems (in order to sterilize, improve the filterability of and condition (a) the waste water before it is introduced into a receiving stream and (b) the sludge before it is composted) and is left to remain there until the heat energy produced by the radioactive radiation has been reduced in its order of magnitude to one tenth of the amount available in the molded bodies upon their completion. The molded bodies, which may be sheathed or coated, are alternatively introduced into raw water used for preparing drinking water in order to sterilize it and are left to remain therein until heat energy produced by the radioactive radiation has been reduced in its order of magnitude to one tenth of the amount available in the freshly prepared molded bodies. An object of the invention is to find a better way to utilize available ultimate storage locations in salt stocks and to reduce the cost of noncontaminating removal or final storage of highly radioactive waste. THEORY OF STORAGE AND TREATMENT-PLANT OVERFLOWS,
C. D. D. Howard.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 102, No. EE4, Proceedings Paper 12310, p 709-722, August 1976. 5 fig, 5 ref, append.

Descriptors: *Runoff, *Sewage treatment, *Overflow, *Storage, *Storm runoff, Combined sewers, Economics, Hydrology, Precipitation, Storm drains, *Treatment facilities, Equations, Computer models, Waste water treatment, Performance.
Identifiers: Storage and treatment plant combination.

The effectiveness of storage in combination with a treatment plant for storm runoff depends on the capacities of the two facilities and the number, duration, and volumes of runoff events which these facilities must process. Computer simulation models can be used for direct evaluation; this paper presented a complementary theoretical method. The theory used a probabilistic description of precipitation as determined from local records and developed statistics of untreated discharge through mathematically derived probability functions. A number of important assumptions were made since it is known that such problems can be mathematically unsolvable. It was concluded that the theory is probably not a practical substitute for computer simulation, but it should provide a means for directing more detailed computer analysis towards the most cost-effective combinations of storage and treatment. (Lardner-ISWS)

THE REMOVAL OF SALT AND ORGANIC MATERIAL FROM SEWAGE EFFLUENT BY ANION EXCHANGE RESINS,
Cape Town Univ. (South Africa). Dept. of Chemical Engineering.
T. B. S. Giddey, J. W. De Kock, and A. D. Carr.
Water SA., Vol 1(1), p 24-29, (1975). 2 fig, 3 tab, 3 ref.

Descriptors: Organic matter, Nitrogen, Phosphorus, *Sewage treatment, Ion exchange, *Resins, *Anion exchange, Salts, *Waste water treatment, Chemical oxygen demand, Sewage effluents, *Desalination.
Identifiers: South Africa.

The removal of both organic material and anions from a domestic sewage effluent has been investigated using two weak base anion exchange resins. The resins are the gel-type Amberlite IRA-68 and the macroreticular-type Amberlite XE-275. Both resins are effective in reducing the COD as well as removing the anions present, though the XE-275 resin shows a higher drop in operating capacity. When linked with a cation column, total nitrogen and phosphate removals can be obtained. (South Africa)

DISSOLVED AIR (PRESSURE) FLOTATION - AN EVALUATION OF INTER-RELATIONSHIPS BETWEEN PROCESS VARIABLES AND THEIR OPTIMISATION FOR DESIGN,
Cape Town Univ. (South Africa). Dept. of Water Resources and Public Health Engineering.
J. Bratby, and G. vr Marais.
Water SA., Vol 1, No. 2, p 57-69, 1975. 22 fig, 3 ref.

Descriptors: *Flotation, *Activated sludge, *Sludge treatment, Cost-benefit analysis, Economics, Design criteria, *Waste water treatment, Aeration, Optimization.
Identifiers: Sludge thickening, South Africa, *Pressure flotation, Flotation tanks.

Dissolved-air flotation applied to activated sludge mixed liquor (at a sludge age of approximately 15 d) showed that bubble-particle attachment occurred efficiently with no form of chemical addition required. Experiments conducted to determine the inter-relationships between process parameters showed that three basic relationships are necessary for design. From an economic optimisation of design variables, for lowest total cost (capital plus capitalised running costs) there is an optimum value related to the wastewater solids concentration and an optimum value related to the float solids concentration. From an economic viewpoint the saturator pressure applied is immaterial provided the recycle ratio is such that, in combination with saturator pressure, the optimum air/solids ratio is achieved. Total costs (capital plus capitalised running costs) for dissolved-air flotation systems are computed for a range of wastewater concentrations, flow rates and float solids concentrations. A design example is presented for thickening activated sludge mixed liquor to a concentration of 6%. (South Africa)
W77-01367

SOUTH AFRICAN PROCESS ELIMINATES DAM POLLUTION.
Construction in Southern Africa, Vol 19 (11), p. 65, (1975).

Descriptors: *Sewage treatment, *Nutrient removal, *Phosphates, *Nitrogen, Pollution abatement, *Waste water treatment, *Aeration, Patents.
Identifiers: *South Africa.

South Africa's Council for Scientific and Industrial Research's National Institute for Water Research has developed a process which can remove nitrates and phosphates from sewage without addition of chemicals. The removal of these nutrients from purified sewage effluents is important because their presence give rise to undesirable algae growth in natural waters into which the sewage is discharged. The process has been patented by the S A Inventions Development Corporation. Two South African companies and one American firm have already been licenced to use the process. (South Africa)

WATER RECLAMATION - QUALITY TARGETS AND ECONOMIC CONSIDERATIONS,
National Inst. for Water Research, Pretoria (South Africa).
L. R. J. Van Vuuren.
Water S A., Vol 1(3), p 133-143, (1975). 4 fig, 10 tab, 6 ref.

Descriptors: *Water reuse, Potable water, Water quality standards, Capital costs, Economics, Treatment facilities, Waste water treatment.
Identifiers: South Africa, South West Africa, Windhoek.

Full-scale reclamation of secondary effluents, both for industrial and unrestricted re-use, has been practised in Southern Africa for a number of years. Cost estimates for potable re-use have confirmed that a high quality water conforming to WHO Standards can be produced at a cost of some 10c/kl. Industrial re-use can produce water at competitive prices. This would offer a rational solution to the increasing demand for water. Operation of reclamation plants for potable re-use requires strict operational control from a health point of view. Risks can be greatly reduced by upgrading the performance of sewage treatment plants and by segregation of industrial toxic wastes. A better approach would be to plan new sewage treatment works as an integral part of a water reclamation system. In this regard, chemical pretreatment followed by biological denitrification and active carbon adsorption appears to be more promising. (South Africa)

ECONOMIC ASPECTS OF WASTEWATER TREATMENT IN SOUTH AFRICA,
Johannesburg City Health Services (South Africa).
V. N. Bolitho.
Water S.A., Vol 1 (3), p 118-120, (1975). 2 tab.

Descriptors: *Urbanization, *Waste water treatment, *Economics, Municipal water, Potable water, Sewerage, Industrial waste, *Aeration, *Treatment facilities, Construction costs.
Identifiers: *South Africa, *Extended aeration.

Rapid expansion of urban populations in South Africa will require additional waste water treatment facilities with a capacity of 10 000-12 000 Ml/d. The cost of constructing plant unit of 100 Ml/d capacity and employing the extended aeration process is estimated at R4,25m with operating cost of 2,25 c/m3. Methods of sludge disposal are changing and new cost structures will have to be taken into account. Estimated investments and running costs for waste water facilities in South Africa during the next 25 years are given. Economic considerations are discussed for the following: purifying municipal effluents to various standards of purity, including that of potable water; industrial waste treatment; and regional sewerage schemes. (South Africa)

THE TREATMENT OF WASTEWATER WITH A ROTATING DISC UNIT, (BEHANDELING VAN AFVALWATER MET DIE DRAAISKYFEENHEID).
National Inst. for Water Research, Pretoria (South Africa).
Municipal Administration and Engineering, Vol 40 (480), p 68-71, (1975). 1 fig, 2 tab, 1 ref.

Descriptors: *Sewage treatment, Oxidation, Operation and maintenance, *Waste water treatment, Ammonia.
Identifiers: South Africa, *Rotating discs.

The South African Council for Scientific and Industrial Research's (CSIR) National Institute for Water Research, used a rotating disc unit (RDU) for the treatment of waste-water where carbon and ammonia had to be oxidized and nitrates had to be reduced. The RDU can be used for improving the quality of effluent from aerobic digesters and septic tanks and require minimal maintenance as no problems with foaming or change of concentration of suspended particles are experienced. The RDU is extremely suitable for the treatment of waste water from small communities. The RDU can oxidise 22 g chemical oxygen demand or 2 g ammoni

nitrogen per sq. meter per day or can be used to reduce 6 g nitrate nitrogen per sq meter per day. The power demand is approximately 2,5 W/m2. (South Africa)

A CASE FOR RECLAMATION,
National Inst. for Water Research, Pretoria (South Africa).
G. G. Cillie, and G. J. Stander.
Suppl. Municipal Engineer, Vol. 5(5), p 33-37 (1974).

Descriptors: Water reuse, Pollution abatement, Economics, Water resources, *By-products recovery, Public health, *Recycling.
Identifiers: South Africa, Windhoek.

The advantages of recycling water, especially in South Africa with its limited water resources, are outlined. It prevents water pollution whilst being an important water augmentation system for producing water conforming to the quality requirements for a wide range of uses and constitutes an economically attractive method of providing new water. The objections to water reclamation have generally pivoted on health considerations and stringent vigilant measures and monitoring will of necessity have to apply where reclamation for potable use is practised. Similar precautions are indeed necessary when polluted surface waters are processed for potable use. It is concluded that a serious responsibility rests upon the municipal engineer to ensure that optimum use is made of the most precious commodity - water. (South Africa)

TREATMENT OF SEWAGE WITH SPECIAL REFERENCE TO AERATION AND METHODS OF AERATION,
National Inst. for Water Research, Pretoria (South Africa).
W. H. J. Hattingh.
Public Health, Vol 75(1), p 3-13, (1975), 2 ref.

Descriptors: *Sewage treatment, *Aeration, Activated sludge, Filtration, Denitrification, Biological treatment, *Waste water treatment.
Identifiers: South Africa.

A general survey is given of the treatment of sewage water as it is being done in the Republic of South Africa at the present time. The treatment of sewage water by means of aeration and aeration method and new developments, like denitrification, are discussed. The biological filter-bed and activated sludge processes as examples of aerobic processes, are also discussed. (South Africa)

THE ECONOMICS OF HANDLING SOLID WASTES (DIE EKONOMIE VAN SOLIEDE AFVALHANTERING),
National Inst. for Water Research, Pretoria (South Africa).
D. G. S. Wolmarans.
Suppl. Municipal Engineer, 5 (5), 58-62 (1974).

Descriptors: Solid wastes, Municipal wastes, Economics, Domestic wastes, Future planning, Waste treatment, Waste disposal.
Identifiers: South Africa.

Some of the economic principles concerning the handling of solid wastes, and some possible alternative approaches, are examined. What the National Institute for Water Research has done and plans to do in this regard and how liaison with the Institute can be used to advantage. Procedures are presented for solid wastes handling methods of household, industrial, garden and street refuse as well as abattoir, plastic and agricultural wastes. The conclusions reached are: (1) municipalities must look for economic solutions to the solid wastes problem; (2) they should collect information about the costs of collection, transport and processing of solid wastes; (3) they should determine how frequently waste removal need be done, and (4) they should consider the planning of regional schemes in conjunction with their neighbors. (South Africa)

IMPROVED ANAEROBIC DIGESTION OF SOLID URBAN WASTE,
M. Moyal.
Municipal Administration and Engineering, Vol 41 (483), p 9-10 (1975).

Descriptors: Waste disposal, Municipal wastes, *Anaerobic digestion, Energy, Energy conversion, Resources development, *Waste treatment, *Solid wastes, Gases.
Identifiers: South Africa, Resources recovery, Bio-energy conversion.

Municipal garbage may yield 1,25 barrels of crude oil or 10,000 cubic feet of gas per ton. In this way the present cumbersome liability may be turned into an asset. Three methods that may be used for gasifying are mentioned and one of the three, anaerobic digestion is discussed in more detail. (South Africa)

PACKAGE PLANT OWNER RESPONSIBILITY AND OPERATION OF SMALL SEWAGE UNITS,
N. P. Nicolle.
Municipal Engineer, Vol 5 (4), p 27-29, (1974).

Descriptors: *Sewage treatment, Biological treatment, Aeration, Operation and maintenance, Operators, *Treatment facilities, *Waste water treatment, Filters.
Identifiers: South Africa, Extended aeration, Biological filters.

The owner responsibilities are explained in ensuring that package plant sewage treatment units operate as satisfactorily as the extravagant claims made for them by their suppliers. Both conventional biological filter type and extended aeration units are discussed and daily, as well as monthly routine checks are prescribed. A description is given as to what to expect of the operator and mention is made of maintenance requirements. (South Africa)

ENGINEERING ECONOMICS OF WATER RECLAMATION,
A. J. Clayton.
Suppl. Municipal Engineer, Vol 5 (5), p 53-55, (1974). 1 fig, 2 tab.

Descriptors: *Waste water treatment, *Treatment facilities, Water resources, *Water reuse, Cost comparisons, Sewage treatment, Economics.
Identifiers: South Africa.

A detailed description is given of the operation of the Windhoek waste water reclamation plant discussing aeration, flocculation, pH correction, clarification, sedimentation and disInfection. Special attention is given to the economics of the operation and all aspects contributing to the total operating cost of 11,5C/K1 is analysed and tabulated. In conclusion it is stated that reclamation is an integral part of Windhoek's water supply and indications are that supply from this source will be increased in future. (South Africa)

SOLID-WASTES RECYCLING: APPREHENSIONS, MISAPPREHENSIONS AND DILEMMAS,
Johannesburg City Engineers Dept. (South Africa).
Val Bolitho.
Municipal Administration and Engineering, Vol 40(473), p 9-18, 35, (1975). 5 tab.

Descriptors: Solid wastes, Landfills, Economics, Incineration, Energy, *Recycling, Municipal wastes, Industrial wastes, Water reuse.
Identifiers: *South Africa.

The issue of solid-wastes-recycling is examined, and the conclusion is reached that we should have serious and growing concern about the long-term availability of resources. However, the cost of recovery from mixed wastes on a large scale is likely to be far higher than income from sales. Recovery can only be economic if the segregation involved can be done at very low cost, but local authorities cannot be expected to embark on idealistically motivated recycling if it involves incurring losses. Recycling outside the refuse circuit, contamination by refuse, fiscal measures for discouraging waste, assessment of controlled landfill and refuse as a direct heat source, are also discussed. THE EPIDEMIOLOGY OF RECLAIMED WATER,
South West African Inst. for Medical Research, Windhoek.
S. S. Grove.
Suppl. Municipal Engineer, Vol 5 (5), p. 49-51, (1974).

Descriptors: *Waste water treatment, Water reuse, *Human diseases, *Epidemiology, Sur-

veys, *Public health, Africa, Potable water, Pollutant identification.
Identifiers: South Africa, *South West Africa, Hepatitis, Gastro-enteritis, Disease detection.

When reclamation of potable water was started in Windhoek the S A Water Research Commission requested the South African Institute for Medical Research to undertake a detailed epidemiological survey of the residents. Relevant available data is briefly discussed in the article under the headings of gastro-intestinal infections, central nervous system diseases, hepatitis and miscellaneous diseases. It is concluded that even though not enough information is available with which to compare the findings of the survey, taking past experience into consideration there does not appear to be any significant change in the occurrence of disease in Windhoek. MANURE DISPOSAL, POLLUTION CONTROL, AND THE NEW YORK DAIRY FARMER,
Cornell Univ., Ithaca, N. Y. Dept. of Agronomy.
D. R. Coote, and P. J. Zwerman.
New York's Food and Life Sciences Bulletin, No. 51, Physical Sciences: Agronomy, No. 3, April, 1975, 19 p. 3 tab, 100 ref.

Descriptors: *Dairy industry, *Waste disposal, *New York, Economics, Regulation, *Farm wastes, Pollution abatement, Water pollution control.
Identifiers: *Land disposal.

Fifty New York dairy farms were visited in 1971 to investigate dairy waste management problems and farmer attitudes toward economic and environmental effects of alternative waste management methods. Two distinct types of dairy farms were noted (1) those with conventional barns (cattle stayed mostly in pasture) and (2) those with freestall barns (cattle permanently confined in barn and exercise yard or pasture). In the pasture system, cattle spread their own manure; in the freestall barn, farmers disposed of the manure. Most farmers felt that all their manure could beneficially be used in field spreading. However, some freestall farmers favored 'dumping' of manure on fields, regardless of environmental effects. Existing regulations that limit pollution by dairies are discussed. Other possible legal approaches are: (1) Restrict the manure amounts to be spread on an area in one year, (2) Restrict manure spreading to soils that are not excessively permeable or excessively impermeable, (3) Restrict manure spreading to flat or only gently-sloping fields, (4) Restrict manure spreading to areas greater than some acceptable distance from surface water capable of leaving the operator's property, (5) Restrict the housing of animals and the spreading of manure to areas greater than some acceptable distance from dwellings and public areas, (6) Restrict manure spreading to certain times of the year, (7) Require that a certain minimum land area be zoned and controlled by the farm operator according to the quantity and type of animals kept, (8) Require that any form of manure disposal, other than land application meet the same controls and standards as those required for industrial or municipal effluent disposal, (9) Require that manure managing be such that no disease, odor, insect, or rodent nuisance is caused. (Penrod-East Central)

MANURE MANAGEMENT IN A 700-HEAD SWINE FINISHING UNIT IN THE AMERICAN MIDWEST: AN INTEGRATED SYSTEM INCORPORATING HYDRAULIC MANURE TRANSPORT WITH RECYCLED ANAEROBIC LAGOON LIQUOR AND FINAL EFFLUENT USE BY CORN (ZEA MAYS),
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
C. V. Booram, and R. J. Smith.
Water Research, Vol. 8, No. 12, p. 1089-1097, 1974. 5 fig, 6 tab, 20 ref.

Descriptors: *Lagoons, *Anaerobic conditions, *Irrigation, *Nitrates, *Groundwater, Hydraulic systems, Water pollution, Crop response, Waste treatment, Corn(Field), Recycling.
Identifiers: *Land disposal.

In recent years livestock production has shifted from pasturing to intensive confinement, resulting in manure management problems. In the midwestern states, anaerobic lagooning has been tested as a management method, with use of renovated waste water for hydraulic transport. Such lagoons convert mixtures of mucal, granular and fibrous solids in manure into a liquid suspension capable of being pumped, with simple, low capacity equipment. However, lagoon liquor has proven to be far too potent to discharge into a watercourse. One solution has been to employ standard irrigation equipment to discharge excess lagoon liquor to croplands. When anaerobic lagooning was first introduced, it was thought that periodic sludge removal would be necessary. However, three sludge removal surveys in a 10 year period have failed to produce evidence that such sludge accumulation occurs. Problems associated with land application of lagoon liquor have been largely due to nitrates. It has been found that annual applications of less than 280 kg N ha-1 can be made on corn with little danger of groundwater pollution and minimal effects on plant tissue. Because anaerobic lagoons are sources of odor, they should be located at least 1 km from residences. Because these lagoons are temperature dependent, they are not recommended for cold climates. Anaerobic lagoons should be as deep as local conditions allow, usually 3-9 m. A loading rate of about 0.08 kg VS m-3day-1 is recommended. Purple sulphur-fixing bacteria control H2S odors and should be encouraged by seeding from other active lagoons. (Penrod-East Central)

LIVESTOCK WASTE MANAGEMENT WITH POLLUTION CONTROL.
North Central Regional Research Publication 222, June, 1975, 89 p. 45 fig, 58 tab, 277 ref. $2.00. J. R. Miner and R. J. Smith, eds.

Descriptors: *Farm wastes, *Feed lots, Biological properties, Chemical properties, Physical properties, Separation techniques, Waste treatment, Byproducts, Transportation, Odor, Dusts, Agricultural runoff, Aerobic treatment, Anaerobic treatment, Recycling, *Waste treatment.
Identifiers: *Waste management, Land application, Refeeding.

The aspects of livestock waste management described in this report reflect the variations encountered across the 13 states of the North Central Region. The main objective of this report is to present information on waste management that will free a livestock producer from unnecessary labor, yet, at the same time, will allow him to operate within the confines of current environmental legislation. The NC-93 committee recognizes that such an objective alone is inadequate; hence, there are large sections of the report devoted to by-product recovery. The report summarizes the necessary features of any livestock waste-management system and presents basic information on manure production and content. The effect of housing on livestock-waste management is discussed in terms of roofed facilities and unroofed facilities. Air pollution by gases and dust is regarded of such importance that one whole section is devoted to this topic. Conventional biological waste stabilization is discussed in two sections on aerobic and anaerobic treatment. The section on utilization attempts to analyze manure processing technology for harvesting useful by-products. Some of the topics discussed include land application with crop production, hydroponics, composting, production of livestock feed supplements, and pyrolysis. The report culminates with two sections on information retrieval and technical terms encountered in livestock waste management. (East Central)

AGRICULTURAL WASTE MANAGEMENT FIELD MANUAL.
Soil Conservation Service, Washington, D. C.
August, 1975, 345 p. 63 fig, 55 tab.

Descriptors: Agriculture, *Legal aspects, *Regulation, *Water pollution, *Air pollution, *Water quality, *Waste water treatment, Solid wastes, Agricultural runoff, Chemical properties, Livestock, Poultry, Crop response, Geology, Fish, Liquid wastes, Solid wastes, Lagoons, Waste treatment, Waste storage waste disposal, Food processing wastes, Pesticides, Equipment, Monitoring, Sampling.
Identifiers: *Waste management, Land disposal.

This manual presents information, data, and guidelines for planning, designing, and operating agricultural waste management systems. It is intended for use by field offices of the U. S. Soil Conservation Service (SCS). It supplements but does not supersede national or state standards, specifications, or requirements of SCS as they pertain to various conservation practices. Topics considered are: (1) Laws, rules, and regulations, (2) Water quality, (3) Municipal waste water treatment, (4) Waste characteristics, (5) The role of soils in waste management, (6) The role of plants in waste management, (7) Geologic considerations in waste management, (8) Fish and wildlife aspects of waste management, (9) Livestock and poultry waste management systems, (10) Food processing waste management systems, (11) Land application of wastes, (12) Waste management system components, (14) Pesticides and other chemicals, (15) Waste management equipment, (16) Monitoring and Sampling. Conversion factors and tables are also supplied along with a glossary of terms. (Merryman-East Central)

ATER QUALITY AND MANAGEMENT HARACTERISTICS OF FEEDLOT RUNOFF OLDING PONDS,
inois Univ., at Urbana-Champaign. Dept. of gricultural Engineering.
C. Dickey, and D. H. Vanderholm.
esented at the 1975 Winter Meeting, American ciety of Agricultural Engineers, Chicago, Il-ois, December 15-18, 1975, Paper No. 75-4568, p. 6 fig, 3 tab, 8 ref.

escriptors: *Water quality, *Feed lots, gricultural runoff, *Illinois, Rainfall-runoff lationships, Nitrogen, Phosphorus, Potassium, arm wastes.
entifiers: *Holding ponds, Land application.

study was initiated in 1974 to evaluate installed noff control facilities in terms of their manage-nt requirements, operator acceptability, and ir effectiveness in preventing water pollution. commercial livestock operations in central and rthern Illinois--beef, dairy, and swine facilities--re monitored for two years. This paper reports findings directly related to characteristics and nagement of the holding ponds. Each runoff ntrol system consisted of a concrete settling sin with a gravity-drain or a pumped outlet, lding pond, and pumping equipment for holding-nd dewatering. Rainfall and runoff data were llected at all the locations. Five holding ponds re sampled monthly; the sixth was sampled ekly. It was found that the quality of holding-nd water is highly variable. Large variations in rogen, phosphorus, and potassium concentra-ns in the water were observed. Nitrogen con-ntration exhibited a definite seasonal trend: low ncentrations during the summer months, in-easing in late fall and winter, reaching a peak in e winter, and decreasing in the spring. It was ncluded that major factors affecting holding-nd water quality are the management of the lot rface, the number of animals in the system, and anges in annual rainfall patterns. In order to gain timum nutrient benefits, dewatering of the hold-pond should occur in the spring. However, de-tering in the fall is still recommended in most uations to provide capacity for winter runoff rage. (Cameron-East Central)

ECOLOGICAL BLUEPRINT FOR TODAY.
rnal of Environmental Health, Vol. 34, No. 1, 0-39, July-August, 1971. 6 fig, 3 tab, 3 ref.

scriptors: *Waste disposal, Sampling, Chemical perties, Physical properties, *Farm wastes, cycling, Application rates, *Waste treatment.
ntifiers: *Land disposal, *Spray irrigation.

e recycling of human effluent and animal waste spray irrigation was discussed. Ten acres of pland and 12 acres of woodland were spray ir-ted. Disposal of liquid manure was at the rate 2 in. per week over a 10-acre tract of cropland ch is equivalent to 20 acre-in. or 544,000 gal. ekly sampling and testing from 32 stations in spray irrigation area were performed for the sence of turbidity, temperature, dissolved ox-n, phosphates, nitrates, nitrites, pH, ABS, and rides. It was found that by taking effluent n agricultural wastes of 200 cows and spray ir-ting the crops with this effluent, production tremendously improved. By utilization of the rients and the water, tonnage per acre in-sed. It was found that animals prefer nutrient-gated crops, as the plants are more succulent contain more phosphorus and other minerals n crops that are just watered. The establish-ment of a community using spray irrigation for handling sewage waste was also described. Results so far indicate that spray irrigation is an effective system. The waste is applied to croplands and woodlands instead of dumping it into streams and lakes. (East Central)

SOME SOIL HYDRAULIC CONSIDERATIONS IN LIQUID WASTE DISPOSAL,
Department of Agricultural Technical Services, Pretoria (South Africa).
D. J. Van Rooyen.
Water SA., Vol 1 (2), p 83-89, (1975). 4 fig, 2 tab, 13 ref.

Descriptors: *Soil hydraulic characteristics, *Waste water disposal, Filtration, Adsorption, Groundwater, Soils, *Soil disposal fields, Water pollution, Liquid wastes.
Identifiers: South Africa.

The disposal of wastewaters on land is very intimately related to the natural hydrologic cycle, and constitutes a man-made modification of that cycle. In carrying out plans for the disposal of wastewater on land, the greatest promise is held by approaches which act in co-operation with natural hydrologic phenomena, rather than by approaches which tend in the opposite direction. Soil disposal of liquid wastes can only be considered to be satisfactory if effluent infiltrates in sufficient quantities and if processes of filtration and adsorption will purify the liquid before it can be recycled. Soil hydraulic parameters pertinent to the problem and which have a sound physical basis, have been considered in preference to empirical soil-water-relations. Both field and laboratory measurements were made of saturated and unsaturated flow regimes. These were followed by the evaluation of theoretical flow models on significant South African soils. Comparisons of the results were made in order to assess the validity of the various approaches. (South Africa)

URBAN SOLID WASTES ENGINEERING,
Johannesburg City Engineer's Dept. (South Africa).
V. Bolitho.
The Civil Engineer in South Africa, Vol 16 (11), p 329-341. (1974), 4 fig, 9 tab.

Descriptors: *Solid wastes, Legislation, *Waste disposal, Waste reuse, *Domestic wastes.
Identifiers: South Africa.

The collection and disposal of urban solid wastes is one of the most important yet most neglected aspects of urban engineering. The problem is complex and the operation inherently expensive. The paper defines the wastes problem, describes the essential elements of a collection and disposal system, deals with recycling of wastes, emphasizes the need for legislation and explains why the problem requires the urgent attention of engineers. DISPOSAL OF BEEF FEEDLOT MANURE,
Texas Agricultural Experiment Station, College Station.
D. L. Reddell, and P. Lyerly.
Progress Report PR-3279C, September, 1975. 5 fig, 19 tab, 21 ref.

Descriptors: *Waste disposal, *Crop response, *Water pollution, *Groundwater, *Agricultural runoff, *Nutrients, *Soil profiles, Odor, Nitrates, Cultivation, *Farm wastes.
Identifiers: *Land disposal.

Research was conducted at the Texas Agricultural Experiment Station in El Paso to study the following: (1) the ability of various tillage equipment to plow under up to 900 tons per acre of manure and cover with sufficient soil to eliminate odors, (2) deep plowing disposal techniques for possible pollution of surface water and (3) crop quality and yields from deep plowed field plots receiving large manure application rates. In May, 1970, beef manure was deep plowed into Vinton fine sandy loam at rates of 0, 300, and 900 tons per acre wet basis. Pollution level of irrigation runoff increased with manure application rate immediately following application, but rapidly decreased to background levels within a couple of months. Soil solution extracts taken from the unsaturated manure disposal plots indicated an increase in ammonium, organic-nitrogen, COD, sodium and chloride with manure application rate. These chemical constituents peaked and in most cases were decreasing by August, 1972. Ground water samples revealed an increase in chemical constituents with manure application rate. Concentrations peaked during 1971 and reduced to background levels by August, 1972. Although significant levels of nitrate accumulate in the soils receiving large manure application, no detrimental

nitrate level occurred in groundwater samples. Denitrification must have prevented this. Yields of corn silage and forage sorghum that were grown on plots receiving up to 900 tons per acre of manure were diminished the first year. However, yields increased during the second and third years. Nitrate levels in these crops were below the nitrate toxicity levels for feeding livestock. Nitrate levels of forage grown on the 300-ton per acre plots and the 900-ton per acre plots were comparable. (Penrod-East Central)

J. R. O'Callaghan, K. A. Pollock, and V. A. Dodd.
Journal of Agricultural Engineering Research, Vol. 16, No. 3, p. 280-300, September, 1971. 6 fig, 13 tab, 22 ref.

Descriptors: *Computer models, *Waste disposal, *Fertilizers, Cattle, Water pollution, Farm wastes, Hogs.
Identifiers: *Land disposal, *Loading rates, Hydraulic loading, Chemical loading.

A computer simulation model has been developed to determine manure output for a group of pigs as a function of diet. The results of this model are incorporated into a second model designed to simulate land spreading of the manure. One of the factors to be considered in land spreading is the hydraulic loading of the soil; this is assessed by comparing actual evapotranspiration with historical rainfall figures and allowing the manure to make up any soil moisture deficiency. Chemical loading is determined by assessing the levels of nitrogen, potassium, and phosphorus that will be removed by the crop or fixed in the soil. Any excess applied over this figure will result in groundwater or runoff contamination. Because of increased soil saturation and decreased organic activity in cold weather, spreading during winter months is not advisable. The farmer should never apply more slurry to the soil than can be immediately absorbed. Crops also affect the maximum permissible chemical loading; intensive grass production permits the maximum loading. To plan a waste disposal system, levels of manure output and its chemical composition must be established. The hydraulic and chemical loading maximums for each field and each crop will allow the minimum acreage required for waste disposal to be calculated. By avoiding the need to purchase fertilizer, the farmer can realize cash value from his manure. For example, if a farmer fattens 5,000 hogs per year, the total cash value of the nitrogen, potassium, and phosphorus content of the manure would be 5000 pounds sterling, with spreading costs of about 1,700 pounds sterling. ULTRAVIOLET WATER PURIFIER,
D. N. Lambert, and R. H. Bennett.
U.S. Patent No. 3,971,947, 5 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 948, No 4, p 1579, July 27, 1976.

Descriptors: *Patents, *Water treatment, *Water purification, *Water quality control, *Ultraviolet radiation, Disinfection, Equipment, *Waste water treatment.
Identifiers: Germicidal effects.

An ultraviolet water purifier has a number of ultraviolet lamps mounted in a cover which extends over the purifier and above the water. A parabolic reflector directs the rays of the lamps toward the body of water. The purifier is provided with a water inlet and a baffle adjacent to it having an opening at its base to compel the water entering the purifier to flow downward and then to flow through a filter. Air bubbles are trapped by a second baffle extending from the cover to below the water level. Before the water is discharged from the purifier, a third baffle which is positioned in approximately the center of the purifier and of lower height than the body of water compels the water to flow to the surface and over the third baffle to be discharged at the end of the purifier opposite that of the inlet thereby exposing the water to the rays of the ultraviolet lamps for a maximum period and at the position at which the rays are most effective as a germicide. Identifiers: *FWPCA Amendments of 1972, C gressional hearings, Administrative regulations.

Prior to 1972, federal water pollution control was based on stream use classification and wa quality standards. Enforcement was difficult si it was seldom possible to pinpoint the discha responsible for lowered water quality. The Fede Water Pollution Control Act Amendments of 1 rely primarily on uniform national effluent lim tions rather than state standards. The goals of act are to achieve water of swimmable quality 1983 and zero discharge by 1985. The author ma tains that a basic conflict exists in that the b technology economically available is not suffici to attain swimmable water quality. Industries be forced to utilize tecnology that is 'better t best' with undesirable results. He recomme amending the act to provide that a cost-ben analysis be made before 'better than b technology is required. A second problem with act is in the area of thermal pollution. Stating t cooling towers may produce worse environme

roblems than discharge of heated water does, the uthor again suggests that a cost-benefit analysis e applied to thermal pollution standards. Capehart-Florida)

entifiers: *FWPCA Amendments of 1972, icenses, *Nuisance(Legal aspects), Estoppel.

hen the Federal Water Pollution Control Act nendments of 1972 were enacted, a permit stem was established for control of pollution. he permit requires compliance with federal scharge limitations and is issued by a federal gency only after state certification that state stan-rds have also been met. The amendments pro-de that compliance with permit terms is deemed give immunity from certain enforcement ac-ons, although not all. For example, the Rivers d Harbors Act of 1899, and the Refuse Act both ovideviable enforcement actions to prohibit scharges into navigable waters despite the immu-ties amendment. In addition, other actions to en-rce oil spill prohibitions apparently survive. hile a variety of estoppel and jurisdictional argu-ents may be made, permittees may find them-lves subject to federal common law nuisance, ate nuisance and state statutory enforcement of ricter pollution standards. URNING WASTES AT SEA--IF THE EPA AP-ROVES,
usiness Week, No 2420, p 86R, February 23, 76. 1 p, 1 photo.

escriptors: *Ships, *Waste disposal, *Water pol-tion control, *Oceans, *Incineration, Burning, nvironmental effects, Administrative agencies, sposal, Oxidation, Wastes, Solid wastes, Ulti-te disposal, Smoke, Costs, Cost analysis.
entifiers: *Incineration ships.

cean dumping of wastes is plainly unacceptable many environmentalists. Large dead areas of e ocean have been reported by Jacques ousteau and others. However, there is presently existance an environmentally superior method at is currently gaining acceptance in the United ates. Waste-burning ships have been used in Eu-pe for some time, and the Environmental Pro-ction Agency (EPA) has just concluded tests on e feasibility of incineration at sea. It was found at there was no evidence of harm to fish or bird e in the vicinity of a burn. Shell Oil Company ed it and found that it worked, with slightly her costs than ocean dumping. The EPA, which layed and hampered Shell's first trials with ad-nistrative red tape, seems ready to permit other mpanies to use the system without any inter-ence. Problems include the cost of waste rage for some time and transportation, often in cially made containers. Nevertheless, in an er-increasing climate of hostility to ocean-mping, incineration at sea seems to be a viable rnative. (Frank-Florida)

SLUDGE,
T. Kidder.
Atlantic, Vol 235, p 62-68, 70, April 1975. 8 p.

Descriptors: *Land use, *Sewage sludge, *Sludge disposal, *Oceans, *Water pollution treatment, Water pollution, Disposal, Waste disposal, Waste treatment, Municipal wastes, Land reclamation, Wastes, Chemical degradation, Biodegradation, New York, Hudson River, Beaches.
Identifiers: *Coastal waters.

Sludge is the end result of much of America's pollution treatment activities. Presently, cities like New York, Boston and Philadelphia are dumping their sludge into offshore waters. A twenty square mile area called the New York Bight is really no more than a dead sea. While mid-western cities like Chicago, Milwaukee, and Houston were laying their sludge productively on land to act as a soil conditioner, these eastern cities were killing large ocean areas. It seems probable that within the next few years the mass of sludge will reach the south shore of Long Island, closing down its beaches for public bathing, perhaps permanently. The solution must come from land deposits. Even though land disposal of sludge is costly, it is better than destroying fish life and plankton resources. However, it should be noted that the Environmental Protection Agency has just approved newer and deeper areas for ocean sludge dumping. (Frank-Florida)

POLLUTER DISCRIMINANT ANALYSIS,
Krannert Graduate School of Industrial Administration, Lafayette, Ind.
D. G. Tock, and G. P. Wright.
Water Resources Research, Vol. 12, No. 4, p 613-616, August 1976. 1 fig, 3 tab, 3 ref.

Descriptors: *Water pollution control, *Data collections, Coasts, Great Lakes, Statistical methods, Mathematical models, Systems analysis.
Identifiers: *Discriminant analysis, Polluters.

A unique water pollution data base for the U.S. coastal waterways and Great Lakes that has been evolving since 1965 is discussed. The pollution statistics in this data base are used to develop a model, employing multiple discriminant techniques, to determine which pollution incident report variables will discriminate the polluter who reports his spill from the polluter who does not report his spill. The results of the analysis indicate that as few as nine out of a possible sixty variables provide reasonable discriminatory power. (Bell-Cornell)

EVALUATING ENVIRONMENTAL QUALITY MANAGEMENT PROGRAMMES IN WHICH DISCHARGERS ARE GROUPED,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
E. D. Brill, Jr., J. C. Liebman, and C. S. ReVelle.
Applied Mathematical Modelling, Vol. 1, No. 2, p 77-82, September 1976. 3 fig, 1 tab, 8 ref.

Descriptors: *Environment, *Quality control, *Management, *Evaluation, Optimization, Methodology, Algorithms, Effluents, Linear programming, Marginal costs, Water quality, Constraints, Standards, Computer programs, Mathematical models, Equations, Systems analysis.
Identifiers: Delaware estuary, Cost minimization, Non-linear formulations, Non-linear branch-and-bound procedure.

Much attention is being directed internationally to evaluating alternative programs for environmental quality management. Presented is an approach to evaluating some of the management programs in which dischargers are divided into groups and treated in a similar fashion within each group. The emphasis is on finding efficient programs for a particular geographic region where ambient environmental quality standards are used. Analogous non-linear mathematical formulations are presented for direct regulation and effluent charge programs, and a non-linear branch-and-bound solution procedure is described. A detailed algorithm is described for the effluent charge case; it is shown to be very practical in an application to data for the Delaware estuary. (Bell-Cornell)

WATER QUALITY CONTROL UNDER UNCERTAINTY: OPTIMAL STOPPING RULES FOR SAMPLING,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
L. Duckstein, C. C. Kisiel, and M. Beckmann.
Journal of Hydrology, Vol. 28, No. 2/4, p 331-342, February 1976. (Published in Amsterdam) 1 fig, 1 tab, 7 ref.

Descriptors: *Water quality control, *Sampling, *Water resources, *Methodology, *Optimization, Biochemical oxygen demand, Constraints, Economics, Stochastic processes, Farms, Irrigation, Salinity, Equations, Systems analysis, Mathematical models, *Risks.
Identifiers: *Stopping rules, Data networks.

One of the functions of water data networks is surveillance and control of water quality. Budgetary constraints reduce the scope of data sampling such that uncertainty about water quality parameters is a consequence. This paper considers the problem of using limited resources to control the sampling of a pollutant, such as biochemical oxygen demand (BOD), in a stream or other water bodies. In this case, BOD would be the state variable. Optimal stopping rules for sampling are developed under the constraints; such rules are desirable because of shifting social uses of the water body. The methodology recognizes that future data networks must be flexible, economical and reliable in the information they generate. The proposed formulation, which stems from modifying existing models, may be a useful framework for controlling the quality of a river or an aquifer (even air quality). An example of controlling the salinity of irrigation water taken from an available source with randomly varying salt concentration points the way toward another possible range of applications. Identifiers: *Saint John River(New Brunswick Canada), Policy planning.

There is an increasing awareness that with our past preoccupation with economic growth we have not given enough importance to the quality of the environment, a vital concern for water resources management. This awareness has manifested itself in the water pollution field and has precipitated the urgen necessity for developing new and better techniques to improve the quality of decisions being made in this area. A promising technique is the application of systems analysis to water resources policy planning andecision making. This article considers the state-of-the-art in mathematical modeling in this field. Discussed are models of the Saint John River System in Canada. Considered is the study area's geography and industry; the use of linear programming and simulation models is described. It is concluded that better understanding of the physical processes involved with water quality management and development of more powerful computer technology and better algorithms during the last decade or so have enables us to analyze more complex systems by means of mathematical models, thus enabling more accurate decisions. COAL AND THE ENVIRONMENT, ABSTRACT SERIES, MINE DRAINAGE BIBLIOGRAPHY, 1910-1976.
Bituminous Coal Research, Inc., Monroeville, Pa.
September 30, 1976, 288 p. Compiled by V. E. Gleason and H. H. Russell EPA Grant 803189.

Descriptors: *Water pollution control, *Mine drainage, *Bibliographies, *Abstracts, Acid mine water, *Mine wastes, Mine water, *Coal mine wastes, Strip mine wastes.

This bibliography of 1,285 references has bee prepared by Bituminous Coal Research, Inc., an National Coal Association, with sponsorship o the Pennsylvania Department of Environmenta Resources and the United States Environmenta Protection Agency. This volume will be signif cantly easier to handle than the eleven separate is sues which had become an unwieldly referenc tool. Entries from the previously published Min Drainage Abstracts which are directly related t water pollution resulting from mining and prepara tion of coal are repeated here. In addition, thi volume has been updated with the inclusion o literature from 1975 and 1976 and also with newl acquired items published earlier but not previousl listed in the bibliographies. The subject areas o material listed in the bibliography cover surfac and underground mines, active and abandone mines, reclaimed surface mines, and planning o new mines. Also included are information on lake formed by surface mining, drainage from co refuse disposal areas, and water from co preparation plants. A large number of items ar concerned with effects of mine drainage on rive and streams. In addition to the abstracts, th volume includes an Author Index and a Gener Index.

WET COOLING TOWER WITH PLUM ELIMINATOR,
Westinghouse Electric Corp., Pittsburgh, P (Assignee).
J. O. Stephens.
U. S. Patent No. 3,965,672, 5 p, 3 fig, 3 ref; Off cial Gazette of the United States Patent Offic Vol 947, No 5, p 1942, June 29, 1976.

Descriptors: *Patents, *Cooling towers, *Wat vapor, Temperature, Velocity, Mixing, Enginee ing structures, Powerplants, Equipment.
Identifiers: Plumes, *Wet cooling towers.

Wet cooling towers, where the circulating water brought into direct contact with the air, und many weather conditions produce a plume. Th can be both a nuisance and a problem, even thou it is essentially pure water, as it often causes loc fogging and icing conditions on nearby roadwa in winter months. In order to eliminate the plu the cooling tower is encircled by an exhau header. The exhaust header is in fluid contact wi the exhaust of the gas turbines which supply h gases to the header. A number of exhaust condu are inclined upward and are generally placed ta gentially with respect to a circle in the cooli tower to thoroughly mix the hot exhaust gas with the moisture laden air, increasing its temper ture and velocity so that as the effluent mixtu emerges from the upper end of the cooling tow its buoyancy and velocity are sufficient to cause to rise into the upper atmosphere, and under mo weather conditions the effluent does not produce visible plume. (Sinha-OEIS)

OIL OR ORGANIC SOLVENT-ABSORBENT,
Teijin Ltd., Osalin (Japan). (Assignee).
A. Omori, I. Okamura, T. Imoto, and T. Katoh.
U.S. Patent No. 3,966,597, 8 p, 4 fig, 2 tab, 12 r Official Gazette of the United States Patent O fice, Vol 947, No 5, p 2244, June 29, 1976.

Descriptors: *Patents, *Oil pollution, *Wat quality control, *Waste water treatment, *Wat pollution treatment, Absorption, Solven *Separation techniques, Plastics, Polymers.

A description is given for an oil or organic solve absorbent for absorbing or removing oils whi have flowed onto the surfaces of the sea or rive or other bodies of water; for absorbing or remo ing waste oils discharged from industrial establis ments; or for absorbing or removing oil or orga solvent which has flowed onto any water surfa or is present in waste water in a floati

ıspended or dissolved state. It was found that a lend of polystyrene and polyethylene is highly ıitable. First an unopened, sheetlike and reticu-ted fibrous structure is made from the resinous lend. Then the blend is admixed with a foaming gent in the molten state. The resulting molten ixture is extruded through a die, quenched at the e exit to a temperature below the glass transition mperature of the blend, and drafted at a draft tio of from the maximum draft ration possible nder the operating conditions to one-third the aximum draft ratio. The sheet-formed fibrous ructures thus obtained possess numerous non-ontinuous cracks or splits along the direction of rafting. Two of the unopened, sheet-formed and ticulated fibrous structures may be superposed ith the directions of their cracks conformed to ch other, pulled in the direction perpendicular to e direction of fibers and extended. This sheet n be used as an absorbent for oils or various or-nic solvents. (Sinha-OEIS)

PPARATUS FOR SPILLING RETRIEVAL,
. P. Kirk, and D. W. Reynolds.
S. Patent No. 3,966,613, 10 p, 12 fig, 13 ref; Of-ial Gazette of the United States Patent Office, ol 947, No 5, p 2250, June 29, 1976.

escriptors: *Patents, *Oil pollution, *Oil spills, ater pollution sources, Water pollution treat-ent, Water pollution control, *Water quality con-ol, Skimming, Separation techniques.
entifiers: Containment, Catamarans, Oil trieval.

ıe invention relates generally to the art of covering floating liquids, particularly oil slicks spillings from tankers and barges in open water. ı apparatus is provided for collecting floating uid spillings which may be pumped into tanks or nfined within retrieval sheets. A vessel is pro-ded that functions not only to deploy the sheet trieval means but also to scoop up and concen-te a quantity of the spilling before deploying the eet. The invention comprises a catamaran con-uction with spaced parallel hulls and bow and rn gates between the hulls forming a well. Each the gates is supported by the hulls for indepen-nt pivotal movement. The gates are operated in njunction with the sweeping movement of the tamaran through a body of water. A feature of e deployment well is the use of an air bubble bar-r around its periphery to assist in concentrating spilling toward the center of the well. The tamaran has a storage deck adjacent the deploy-nt well. A jib crane is located in position to liver the retrieval means to the deployment well needed. Variable ballast means are adapted to ange the draft of the catamaran according to its ight in order to ensure an optimum draft during sweeping operation. (Sinha-OEIS)

L SPILL CLEANUP SYSTEM,
ell Oil Co., Houston, Tex. (Assignee).
R. Ayers.
S. Patent No. 3,966,614, 11 p, 14 fig, 11 ref; Of-al Gazette of the United States Patent Office, 1947, No 5, p 2251, June 29, 1976.

scriptors: *Patents, *Oil pollution, *Oil spills, ter pollution sources, Water pollution treat-nt, *Water pollution control, *Water quality trol, *Skimming, Equipment, Separation hniques.
ntifiers: Containment, Oil retrieval.

kimmer for removing oil from the surface of a ly of water is articulated from front to rear to wave comformable and/or has a quiescent col-ion zone formed by bottom and/or forward fles. A flexible skimming head for use with or ependently of the skimmer is composed of a ıminous sheet having an integral chevron flow tern on its upper surface. A floating skimming head for use similar to the preceding head has a central, axially vertically movable cone or other configuration forming a suction mouth. A boom for use with or independently of the skimmer is composed of converging double booms. Storage capacity for oil collected by the skimmer is composed of onboard and/or offboard membranes. The baffles which divide the open front end of the skimmer into separate adjacent chambers open at front and rear to permit passage of oil and water and are of sufficient length to substantially arrest orbital water particle motion associated with waves without substantially impeding flow. They also act to diffuse and downward direct water exiting from the compartment and act to create a quescent oil capture zone within the compartment. (Sinha-OEIS)
W77-01203

OIL COLLECTION BARGE,
S. L. Petchul, and R. K. Petchul.
U.S. Patent No. 3,966,615, 5 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 2251, June 29, 1976.

Descriptors: *Patents, *Oil pollution, *Oil spills, Water pollution sources, *Water pollution control, Water pollution treatment, *Water quality control, Skimming, *Barges, Separation techniques, Equipment.
Identifiers: Oil collection, Containment.

The oil collection barge is a device which is intended for use in cleaning up oil spills and is especially useful where ultra large spills and adverse sea states are concerned. The device is capable of covering large areas quickly while it deals with the sea state and forces the oil floating in the path of the barge into the channel where the oil is not only contained but also rapidly concentrated. As a result of this initial concentration of the oil slick the actual separation process is made more efficient. The oil collection equipment and devices consist of a longtudinal U shaped channel with an adjustable water and oil intake funnel or wave dampner at the forward end, an oil blockage wall at the rear, an adjustable flow splitter at the rear, a water vent at the rear bottom and an adjustable vent plate at the rear bottom such that the water enters through the funnel, flows through the channel, and flows out the vent. The oil being lighter than water will enter through the funnel, flow aft in the channel, and be trapped by the blockage wall and channel sides while the water will flow through. The trapped oil is removed from the channel surface and is transferred to a holding tank by means of a spill gate, a floating suction bell and pump, or any other suitable means. (Sinha-OEIS)
W77-01204

APPARATUS FOR COLLECTING OIL SLICK FROM A BODY OF WATER,
E. A. De Voss.
U. S. Patent No. 3,968,041, 20 p, 27 fig, 14 ref; Official Gazette of the United States Patent Office, Vol 938, No 1, p 250, July 6, 1976.

Descriptors: *Patents, *Oil pollution, *Oil spills, Water pollution sources, Water pollution treatment, *Water pollution control, *Water quality control, Conveyance structures, Adhesion, Separation techniques.
Identifiers: Oil slicks, Endless belts, Artificial grass.

A system for removing oil slicks from water surfaces such as the ocean, harbors, lakes or ponds uses an endless conveyor, for example, the surface of a drum or of a belt. The surface contacts the oil slick which adheres to it. The slick is conveyed by the conveyor to a means for its removal such as a wringer. The invention uses a flexible, relatively limber, flat blade-like cover for the conveyor such as the well-known artificial grass 'Astroturf'. The conveyor overhangs and presses against the top of the oil slick to that the oil can adhere to the conveyor. A second convey on aft of the first conveyor extends below the elevation of the first conveyor so that they form a wedge-shaped path in which the oil tends to be trapped and drawn. The system can be mounted to floating support means and for moving it along the oil slick. (Sinha-OEIS)
W77-01211

FLOATING SKIMMER FOR CLEANING THE SURFACE OF A BODY OF LIQUID, METHOD AND APPARATUS,
D. J. Gore.
U. S. Patent No. 3,970,556, 10 p, 8 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 948, No 3, p 1100, July 20, 1976.

Descriptors: *Patents, Water pollution treatment, *Water pollution control, *Water quality control, Water pollution sources, *Skimming, Floating, Floats, Weirs, Films, Separation techniques.
Identifiers: *Skimmers, Air-borne pollutants.

The majority of the dirt and debris that gets into a body of water is airborne. Water has a surface tension which tends to retain most of this airborne dirt and debris in a relatively tough film on the very upper surface. A floating skimmer which is manually controlled to remove this contaminated film is described. The skimmer comprises an outer ring shaped body having an inner, central cavity. A flotation and ballast chamber is formed integrally in the outer body. An inlet opening in one peripheral part of the outer body admits a flow of liquid into the central cavity. The liquid in the cavity is pumped through a drain opening in the base plate. A movable weir extends across the width of the inlet opening. It is connected to the outer body along its outer edge by a hinge connection which permits articulation to regulate the quantity of and velocity liquid flowing through the opening and into the central cavity. A float on the bottom of the weir rides on the liquid within the central cavity and adjusts the level of the weir in relation to the height of the external liquid. The incoming water flowing through the opening must therefore flow over the inclined weir, and it falls off the back, inner edge of the weir in a cascade action. By maintaining the weir at the proper height, the incoming water is accelerated, and the waterfall or cascade effectively pulls the upper film from the water. Because of the acceleration produced by the inclined weir, the skimmer very quickly cleans the entire water surface around the skimmer. (Sinha-OEIS)

OIL FENCE,
Mitsubishi Electric Mfg. Co. Ltd., Amagasaki (Japan). (Assignee).
T. Kinase, I. Yano, K. Okubo, H. Kitakoga, and H. Tayama.
U. S. Patent No. 3,971,220, 9 p, 19 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 948, No 4, p 1342, July 27, 1976.

Descriptors: *Patents, *Oil pollution, *Water pollution control, *Water quality control, *Barriers, Floating, Structures, Equipment, *Separation techniques.
Identifiers: Oil fences, Containment.

An oil fence is described which has in combination, a longitudinally elongated, shielding screen member of flexible material; a number of rigid reinforcing strips placed at predetermined intervals on the screen member; one split float unit placed on the screen member about each of the reinforcing strips; sinkers placed at one of the longitudinal edges of the screen member through its length; and a length of reinforcing rope placed on the surface of the screen member to extend longitudinally. An improved take up apparatus is used for housing and spreading the oil fence in a simple manner and high efficiency. A box-like chamber

with attached buoys has a take-up shaft on which the oil fence can be coiled or uncoiled. (Sinha-OEIS)

SULFURIC ACID FOR THE TREATMENT OF AMMONIATED IRRIGATION WATER: II. REDUCING CALCIUM PRECIPITATION AND SODIUM HAZARD,
New Mexico State Univ., Las Cruces. Dept. of Agronomy.
S. Miyamoto, and J. Ryan.
Soil Science Society of America, Journal, Vol. 40, p 305-309, 1976. 1 fig, 6 tab, 13 ref.

Descriptors: *Irrigation operation and maintenance, *Hydrogen sulfide, *Mine wastes, *Irrigation efficiency, Water utilization, Water quality, Southwest U.S., Infiltration, Ammonia, Lime, Chemical wastes, Industrial wastes, Pollution abatement, Fertilizers.

Effects of the application of ammonia and sulfuric acid to ammoniated water on Calcium precipitation and Na-Hazard of irrigation water are evaluated theoretically, using known relations of ion equilibria, and tested with laboratory and greenhouse experiments. Results show severe precipitation of Ca2+ when ammonia is applied to alkaline irrigation water. Ammonia application also increases exchangeable Na and NH4, and can reduce water infiltration rates, especially when irrigation waters contain high Na+ relative to Mg2+ and Ca2+. Sulfuric acid applied to ammoniated water neutralizes OH- produced by ammonia application, reducing Ca precipitation and exchangeable Na. This prevents a decline in infiltration rates. Sulfuric acid, now available as a pollution abatement byproduct in the Southwest, can be used for correcting excessive lime incrustation or poor water penetration induced by the use of anhydrous or aqua ammonia without corroding irrigation systems. Identifiers: *Common property resources, *Transnational pollution, Public goods, Transfer payments.

Described is an economic model that incorporates externalities between countries and regions arising from the existence of common property resources, e.g., fisheries, oil fields, and mineral deposits lying beyond respective territorial limits, and pollution. The model represents a national policy to maximize a social welfare function with the assumption that the only tools available to this government are tariffs and subsidies. The model then attempts to solve and interpret a set of prerequisite conditions that must be satisfied by an optimal tax structure when the tax-imposing country behaves in an uncooperative fashion toward foreign planners. Then the dependence and interaction between two countries in the presence of such a bilateral externality are analyzed. The objective is to define a type of cooperative behavior and compare it to the noncooperative behavior. Of particular interest is the relationship between the set of allocations resulting from the cooperative behavior and the set of allocations that are Pareto-efficient from the world's point of view. The major finding is that a cooperative imposition of national production taxes, or any other form of cooperative output adjustment, will not guarantee Pareto efficiency, but there does exist a transfer payment in connection with a cooperative tax adjustment that will produce a Pareto solution. GUIDELINES FOR LAKE WATERSHED MANAGEMENT PLANNING.
Maine Dept. of Environmental Protection, Augusta. Bureau of Water Quality Control.
Pilot Lakes Study, April 1976. 201 p. 19 fig, 10 tab, 46 ref, 4 append.

Descriptors: *Planning, *Watershed management, *Land use, *Methodology, Water quality control, Eutrophication, Evaluation, *Maine, Data collections, Phosphorus, Carrying capacity, Statistical methods, Computer programs, Environmental effects, Economic efficiency, Constraints, Competing uses, Feasibility, Social aspects, Economic impact, Institutions, Input-output analysis.
Identifiers: *User manual, Case study, Phosphorus load, Real estate development, State-of-the-art.

Information essential to planning, with the principal goal of water quality protection or improvement through control of water and related land uses, is presented. Detailed are procedures for determining goals and objectives and application of standard or improved tools and techniques. The planning process is initiated with an inventory of natural and cultural features of two Maine watersheds. Aerial photographic interpretation was complemented by on-site investigations to identify the nature and extent of natural resources and existing user patterns. A computerized data system, RIMPS (Resource Inventory Management Planning System), was developed to assist storage, retrieval and analysis of geographically oriented information. Black and white, low-level, aerial stereo photographs were used to develop a graphic base and ultimately stored in the computer. Techniques are detailed for various combinations of land and water resource elements to determine the natural suitability for particular uses and compared with existing uses to determine the current capacity for specified uses. Recommendations for corrective action are illustrated, with estimates of costs vs. benefits. Measured economic and other resource variables were combined with the assistance of RIMPS and a Trophic State Index to assess their implications for maintaining and improving water quality. Assessment of the lake as an economic resource, synthesized with water and land use suitabilities and development capacity, becomes the basis for lake watershed management plans and institutional needs. (Auen-Wisconsin)

COFFEE POND WATERSHED MANAGEMEN PLAN.
Maine Dept. of Environmental Protection, A gusta. Bureau of Water Quality Control.
Pilot Lakes Study, April 1976. 95 p. 29 fig., 48 ta 26 ref.

Descriptors: *Planning, *Watershed manageme *Land use, *Water quality control, *Methodolog Eutrophication, Evaluation, *Maine, Data coll tions, Phosphorus, Carrying capacity, Statisti methods, Computer programs, Environmental fects, Economic efficiency, Constraints, Comp ing uses, Feasibility, Social aspects, Economic i pact, Institutions.
Identifiers: *Residential development, *Coff Pond watershed(Maine), Pilot study, Phosphor load.

Management procedures developed by Main pilot study program demonstrate stand methods for planning a lake watershed as focu on Coffee Pond and the future development of s gle-family, detached residential dwellings wi cellars and on-site wastewater disposal subject the constraint that lake water quality (as indica by phosphorus loading only) should not degraded beyond a pre-determined level. It stressed that this is a demonstration of stand methods and is neither designed nor intended present a comprehensive plan for watersh management. Inventory analyses techniq similar to those described should also be applied such issues as industrial or recreational devel ment, development or roads and utilities, con of land use, etc. And constraints other than wa quality to be considered are community gro goals, economics, conservation of open space, The data base utilized the RIMPS (Resource ventory Management Planning System) compu programs and the input included terrestrial f tures, climate, limnology of Coffee Pond, cultu features, including existing land and water us economic data included demographic factors, dustries, dwellings and commercial property, undeveloped property; and an institutional ov view. The environmental impact of the devel ment, the carrying capacity, and the feasibility related to social, economic, and institutional f tors of the watershed are also analyzed. (Au Wisconsin)

ntifiers: RIMPS Computer program.

MPS is a computer software package which per-
ms planning functions to enable the user to in-
tory natural resources, demographic charac-
stics, and economic data within a defined area.
displays inventoried data graphically and to
le, provides a means for ascertaining land use
tability within natural and cultural constrants,
enables the user to identify conflicts between
sting or proposed land uses and the suitability
these uses. It also provides a means for deter-
ing preferred land uses. RIMPS is composed of
computer programs labeled LANDCP (lnd
e), IRR (irregular outline), DATA (data file),
ID-1 (grid or map), and ATTR-2 (attractiveness
gram). LANDCP, IRR and DATA read in and
e inventoried resource characteristics data on
computer; these programs create the data files
use in the GRID and ATTR programs. The
ID program creates a map of the stored data,
depending upon usage, stores the map for
her use or prints out the map as the program
cutes. ATTR essentially provides the user with
ability to develop land use planning alterna-
s in a 'gaming' format. This manual gives the
iled procedure for using RIMPS. RIMPS hard-
e requirements are currently limited to disk
es, 250k memory and FORTRAN language
ed to the Control Data Cybernet System.

A LABORATORY EVALUATION OF A DYE FOR THE CONTROL OF ALAGAL GROWTH,
National Inst. for Water Research, Pretoria (South Africa).
R. D. Walmsley, W. E. Scott, and D. F. Toerien.
Water SA, Vol 1(2), p 90-92, (1975). 2 fig, 3 tab, 7 ref.

Descriptors: Algae, Aquatic weed control, Light penetration, *Dyes, *Growth rates.
Identifiers: South Africa, *Anacystis nidulans, *Selenastrum capricornutum, *Algal growth control.

The principle of the use of a dye for the control of algal growth was investigated at the laboratory scale. The commercial dye employed was shown to have little effect on the growth rates of Anacystis nidulans and Selenastrum capricornutum in the laboratory at concentrations above the recommended doses. Experiments using 200 l tanks also substantiated this lack of effect on mixed phytoplankton populations. It is suggested that a dye with absorption characteristics closer to those of algal pigments might be more effectual for algal growth control. (South Africa)

OIL-SPILL DISPERSANT FOR MARINE POLLUTION (LEKOLIEDISPERGEERMIDDEL VIR SEEBESOEDELING).
South African Bureau of Standards, Pretoria.
SABS-BULLETIN, Vol 4, (4), p 68-72, (1974).

Descriptors: *Oil pollution, *Oil spills, Beaches, Standards, *Dispersion, Toxicity, Lethal limit, *Water quality standards.
Identifiers: *South Africa.

A description is given of the first specifications for oil spill dispersant for use in dispersing crude and fuel oil floating on sea water, as well as for use in beach cleaning compiled by the South African Bureau of Standards. The specification lays special stress on dispersing efficiency, suitability for use in spray equipment and toxicity to marine life. The specification also makes provision for prohibited ingredients, such as benzines, chlorinated hydrocarbons, phenols, creosols, free caustic alkalis, mineral acids, while other requirements include consistency, flash point, cloud point, viscosity and corrosiveness. Provision has also been made for compatibility of the dispersant with other dispersants. (South Africa) (In Afrikaans and English)

LEAF ANALYSIS PROVES USEFUL IN INCREASING EFFICIENCY OF NITROGEN FERTILIZATION OF ORANGES AND REDUCING NITRATE POLLUTION POTENTIAL,
California Univ., Riverside. Dept. of Plant Sciences.
T. W. Embleton, W. W. Jones, and R. L. Branson.
Commun Soil Sci Plant Anal. 5(5), p 437-442, 1974.

Descriptors: *Nitrogen, Oranges, *Water pollution control, *Analytical techniques, *Leaves, *Fertilizers, *Pollutant identification.

In some areas in California N usage is now less than half of what it was prior to 1960. The reduction was associated with increased commercial usage of leaf analysis as a guide to N fertilization. Since 1960, as a result of the decrease in fertilizer applied, the annual per-acre amounts of fertilizer N that were subject to leaching in the Santa Ana Watershed were reduced by an estimated 50% in Riverside County and about 80% in San Bernardino County.--Copyright 1975, Biological Abstracts, Inc.

RULES AND REGULATIONS: CONFINED FEEDING OPERATIONS.
Iowa Department of Environmental Quality, Water Quality Commission, 1971, 4 p.

Descriptors: *Regulation, *Iowa, *Waste water disposal, *Water pollution control, *Farm wastes, Feedlots, Water quality standards.
Identifiers: *Open feedlot, *Confinement feeding operation, Registration.

An open feedlot (unroofed or partially roofed adjacent or nearby animal enclosures on a single property) is defined in terms of specific animal populations and population densities. Confinement feeding operations (roofed or partially roofed adjacent or nearby animal enclosures on a single property from which wastes are removed as a liquid or semi-liquid) are defined in terms of maximum number of animals confined at one time. These data are given for beef cattle, dairy cattle, swine, sheep, turkeys, and chickens. Conditions requiring registration are outlined along with requirements for the facilities and for operation of the facilities. Feedlot pollution control facilities constructed in accordance with rules in effect at the time of construction shall not be required to be reconstructed due to subsequent rule changes unless the commission finds that waste discharge from such facilities is causing water pollution. Such facilities shall, however, be brought into compliance with rules in effect at the time of reconstructing, enlarging or otherwise modifying the confined feeding operations or control facilities. SULFURIC ACID FOR THE TREATMENT OF AMMONIATED IRRIGATION WATER: I. REDUCING AMMONIA VOLATILIZATION,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
S. Miyamoto, J. Ryan, and J. L. Stroehlein.
Soil Science Society of America Proceedings, Vol. 39, No. 3, p 544-548, May-June 1975. 4 fig, 7 tab, 11 ref.

Descriptors: *Irrigated water, *Ammonia, *Ammonification, Water quality, Fertilizers, Fertilization, Acids, Waste disposal, Water pollution control, Waste water treatment.
Identifiers: *Sulfuric acid, *Ammonia volatilization reduction.

Effects of sulfuric acid applied to ammoniated irrigation waters on ammonia volatile losses are analyzed theoretically and evaluated by laboratory and field experiments. Volatile loss of ammonia from irrigation waters is directly related to the concentration of NH4OH. Sulfuric acid application reduces the concentration of NH4OH relative to the total N applied as anhydrous or aqua ammonia, principally by lowering pH. This consequently reduces ammonia volatile loss, e.g., by as much as 50% when acid is applied at rates equivalent to ammonia. The reduction of ammonia loss by sulfuric acid application through forming HNH4SO4- is nil. Simultaneous application
acid and ammonia may serve as a practical mea
of controlling ammonia loss as well as disposing
large quantities of projected surplus acid witho
reducing pH of irrigation water. (Skogerboe-Co
St)

A REVIEW OF THE POLLUTION ABATEME
SITUATION IN INDUSTRY, MUNICIPALITI
AND GOVERNMENT,
Environmental Protection Agency, Washingt
D. C. Office of Solid Waste Management P
grams.
T. W. Bendixen.
In: Proceedings of Farm Animal Waste C
ference 'Farmer Experiences, Codes, Guidelin
Research Progress, Equipment', Stevens Poi
Wisconsin, February 9-10, 1972, p. 5-9.

Descriptors: *Water pollution, *Air pollutio
*Regulation, Liquid wastes, Solid wastes.

Mr. Bendixen reviews activities and programs
the Federal government related to pollution abe
ment. Among regulations reviewed are: (1)
Clean Air Amendment of 1970, (2) the Refuse A
of 1899, and (3) the Federal Water Pollution C
trol Act. Geographical coverage, variation in lo
conditions, varying assimilative capacities
water bodies and nature and interaction of poll
tants complicate any attempt to accurately ra
sources as to severity or to show trends of wa
pollution. However, using biochemical oxygen
mand as the criterion, many people feel that ind
trial wastes are the largest source of organic wa
pollutants nationwide; then municipal wastes; th
agricultural wastes. Environmental improvem
is a task of all the people, and every segment

ty, whether it be cities, towns, industry, ulture, business or governmental activities. also W77-01521) (Merryman-East Central) 01522

EVIEW OF ANIMAL WASTE REGULA-S AROUND THE NATION,

ion problems and attempts at pollution ment from colonial days to the present are ssed, citing specific pollution problems and tions. This is background for speeches to later which deal with the proposed Animal Rules. (See also W77-01521) (Merryman-Central) 01524

AL WASTE PROBLEMS NOW FACING DEPARTMENT OF NATURAL URCES,
onsin Dept. of Natural Resources, Madison. trial Waste Water Section.
Didier.

In: Proceedings of Farm Animal Waste Conference 'Farmer Experiences, Codes, Guidelines, Research Progress, Equipment', Stevens Point, Wisconsin, February 9-10, 1972, p. 21-28. 3 fig.

Descriptors: *Regulation, *Water pollution, *Wisconsin, Waste storage, Waste disposal, Agricultural runoff, *Farm wastes.

The Wisconsin Department of Natural Resources' statutory authority and responsibilities in relation to water pollution and more specifically as related to animal wastes are reviewed. Various types of agricultural pollution are pinpointed. Manure management problems include: manure storage and disposal, the need for manure management alternatives, feedlot runoff, and livestock destroying banks of unfenced streams. Regulatory, advisory and cost sharing agencies must be coordinated to solve these problems. Any solution to the animal waste management problem will involve a mix of programs, combining regulation, research, education, financial assistance, voluntary actions by the farmer himself and even tolerance on the part of the non-farming population. (See also W77-01521) (Merryman-East Central)
W77-01525

PROPOSED ANIMAL WASTE REGULATIONS FOR WISCONSIN,
Wisconsin Univ., Madison. Dept. of Soil Science.
M. Beatty.
In: Proceedings of Farm Animal Waste Conference 'Farmer Experiences, Codes, Guidelines, Research Progress, Equipment', Stevens Point, Wisconsin, February 9-10, 1972, p. 32-36.

Descriptors: *Regulation, *Agricultural runoff, *Waste storage, *Wisconsin, Water pollution control, Water pollution sources, *Farm wastes.
Identifiers: *Waste management, Land spreading.

Background is given on how the ad hoc committee on agricultural waste pollution operated and how the animal waste rules were developed. Some of the major provisions of the rules are discussed. The rules begin with definitions of terms. The rules focus on water pollution. They give standards for systems of manure storage and handling. Plans for storage ponds and retention ponds must be reviewed by the Department of Natural Resources. The rules require plans for large operations, those that are greater than 800 animal units, to be submitted to the Department of Natural Resources for review. If manure is spread in the winter and no erosion control program is used, the spreading must be back a minimum of 200 feet from streams, lakes, ditches and ponds. The rules concentrate on point sources. Streams, lakes and ponds must be fenced out of the barnyards by 1975; and the runoff from animal lots and enclosures must be controlled so that the manure won't simply go under the fence and into a stream. A feedlot operator must have a minimum land area under his control for spreading of manure. One-third of an acre per animal unit for dairy, beef, swine, and sheep, and half an acre per animal unit for birds are the minimum areas suggested. The problem of odors is not dealt with due to their subjective nature. (See also W77-01521) (Merryman-East Central)
W77-01526

DEPARTMENT OF NATURAL RESOURCES PROPOSED ANIMAL WASTE MANAGEMENT RULES.
Wisconsin Dept. of Natural Resources, Madison.
In: Proceedings of Farm Animal Waste Conference 'Farmer Experiences, Codes, Guidelines, Research Progress, Equipment', Stevens Point, Wisconsin, February 9-10, 1972, p. 40-44.

Descriptors: *Regulation, *Waste storage, *Waste disposal, *Waste treatment, *Agricultural runoff, *Wisconsin, Water pollution, *Farm wastes.
Identifiers: Inspection.

The Proposed Animal Waste Management Rules are given. The preamble states that when wastes from agricultural activities impair water quality, systematic prevention or remedial action is required. The proposed rules establish standards and define procedures whereby the state can protect the public interest in maintaining the quality of water in Wisconsin. The recycling of animal wastes to the land and the continued development of new and innovative systems are encouraged. Coordination of the efforts of regulatory, educational, technical, and financial assistance program of other governmental agencies is also encouraged. Further technical development is necessary before rules controlling odors can be formulated. The Department of Natural Resources will continue to handle odor complaints individually and will promote further study of the problem. The rules will be periodically reviewed and, when necessary, revised to reflect advancing technologies of agricultural production and environmental protection. Outlined in the proposed rules are: (1) Definition, (2) Collection, storage and disposal of animal wastes, (3) Treatment of animal wastes, (4) Runoff control (animal shelters, enclosures and lots), (5) Filing of reports, plans and specifications, (6) Violations and enforcement, (7) Hearings, orders and appeals, (8) Inspection, (9) Limitations, (10) Severability, and (11) Applicability and effective date. IMPLICATIONS OF EPA PROPOSED REGULATIONS OF NOVEMBER 20, 1975 FOR THE ANIMAL FEEDING INDUSTRIES,
Department of Agriculture, Washington, D. C. Animal Waste Subcommittee.
January 30, 1976, 39 p. 21 tab.

Descriptors: *Regulations, *Economics, *Water pollution sources, *Feed lots, Livestock, *Farm wastes.
Identifiers: *National Pollutant Discharge Elimination System, Waste management.

The Environmental Protection Agency's National Pollutant Discharge Elimination System (NPDES) proposed regulations of November 20, 1975, for livestock operations could require an estimated 94,500 operations to apply for permits. The information contained in this report is based on expert opinion (not surveys) of USDA and State research and extension personnel located in major livestock producing States and was not available when EPA proposed the regulations. Of the estimated 94,500 operations affected by NPDES regulations--man-made waste conveyance, navigable water traversing the operation, and large operations--there are 14,000 beef, 32,000 dairy and 48,500 swine operations. In addition an estimated 250 turkey range operations would be affected. Estimates indicate that less than 4 percent of the operations that would be affected have capacities of more than 300 animal unit equivalents (300 beef animals, 750 swine and 210 dairy cows). Over 70 percent of the operations judged to be affected had capacities of less than 100 beef animals, 250 swine and 70 dairy cows. In order to comply with the proposed regulations, it is likely that affected operations would have to install systems to control discharges. Additional investments to install these systems would amount to about $205 million. For an additional 10 percent of the operations, the least-cost method of meeting proposed regulations would be to relocate the operation. The estimated 94,500 operations affected account for 20 percent of total fed beef marketings, 19 percent of milk sales, and 11 percent of hogs and pigs marketed. The proposed regulations contain a further provi-

sion for identifying a 'concentrated animal feeding'. This provision allows for 'case-by-case' designation of additional operations, regardless of size, that must apply for an NPDES permit, but the factors determining the outcome of these determinations are not listed in the proposed regulations. LIVESTOCK AND POULTRY WASTE DISPOSAL CONTROL,
North Carolina Agricultural Extension Service, Raleigh.
G. Kriz.
Circular 556, February, 1973, 8 p.

Descriptors: *Air pollution, *Water pollution, *North Carolina, *Regulation, Waste disposal, Waste treatment, Feed lots, *Farm wastes.
Identifiers: *Waste management, *Land disposal.

Questions on air and water pollution control for livestock and poultry wastes are answered in this publication by the North Carolina Agricultural Extension Service. Areas of pollution control covered, include (1) Definitions of pollution and nuisance according to North Carolina Law, (2) Factors which determine how animal wastes become a nuisance or cause pollution, (3) Responsibilities of various state agencies, (4) Regulations--local, state or federal--that apply to animal waste disposal, (5) Services provided by the Board of Water and Air Resources, and (6) Assistance that is provided to animal producers by agencies, conservation services and agricultural departments in pollution control and prevention. Conditions affecting pollution potential of animal wastes, methods of animal waste management and land application rates are discussed. Final questions are answered that examine (1) where responsibility lies in insuring that pollution does not result from an animal operation, (2) methods for avoiding pollution when a production unit continues at the same level and (3) methods for avoiding pollution when a production unit either expands or builds a new facility. THE EDITOR'S NOTEBOOK: ABOUT DISCHARGE REGULATIONS.
The Catfish Farmer, Vol. 6, No. 1, p. 7-8, January, 1974.

Descriptors: *Catfishes, *Runoff, *Permits, Regulation, Waste disposal.

Most catfish farming is exempted under new EPA regulations. Those facilities not subject to NPDES requirements are: (1) closed ponds with discharges only during annual harvesting or during periods of excess runoff, (2) facilities where discharges occur less than 30 days a year, and (3) facilities where flow is continuous but total number of pounds produced per year is less than 20,000 pounds. HOW NOW BROWN COW: REGULATION OF FEEDLOT POLLUTION IN WISCONSIN,
C. E. Blackwell, III.
Environmental Affairs, Vol. 3, No. 4, p. 769-789, 1974.

Descriptors: *Feed lots, *Pollution abatement, *Wisconsin, *Legal aspects, *Water pollution.
Identifiers: *1972 Federal Water Pollution Control Amendments, *National Pollutant Discharge Elimination System.

Water pollution due to feedlot runoff has become a serious problem. Several legal steps are reviewed in this article which are (or have been) directed toward pollution abatement. Of major importance among such legal steps is the 1972 Federal Water Pollution Control Amendments. Section 402 of the 1972 Act establishes the National Pollutant Discharge Elimination System which has been utilized to reduce point source water pollution by feedlots. The Environmental Protection Agency (EPA), which was granted authority to administer the permit program established by this Act, has attempted to abrogate the effectiveness of the Act. This may be due to any or all of the following: (a) To include greater numbers of small feedlots would place an unacceptable economic and manpower burden on the EPA, (b) EPA pollution control efforts have been focused on urban sources of water pollution, and (c) The EPA is sensitive to criticisms from Agribusiness. While the major concern has been that strict pollution controls would cause economic dislocation, some sources such as David Blitzer (National Resources Defense Council), maintain that such controls would foster reorganization of the industry into larger and more efficient production units. The threat to water quality by agricultural runoff pollution cannot be dealt with in the manner employed to date. The problem can only be solved through the cooperation of federal, state, and local governments which, unfettered by self-interested pressure groups or concerns over administrative burdens, have the resolve and energy to obtain a high standard of water quality. (Merryman-East Central)

MANAGEMENT AND CONTROL OF BEEF FEEDLOT WASTE,
O. E. Cross, and C. B. Gilbertson.
Farm, Ranch, and Home Quarterly, Nebraska Agricultural Experiment Station, Lincoln, p. 20-21, Winter, 1969. 2 fig.

Descriptors: *Feed lots, *Cattle, *Nebraska, *Regulation, *Agricultural runoff, *Water pollution, *Farm wastes.
Identifiers: Detention ponds, Rainfall.

Feedlot owners are being given the legal responsibility for insuring that their operation does not contaminate Nebraska's water. The Water Pollution Control Council of the Nebraska State Department of Health has been charged with setting up regulations to maintain Nebraska's water quality. Since information on the most effective ways to dispose of feedlot waste was not available, the Nebraska Livestock Feeders Association and its Pollution Control Committee were given two years to research and develop information on which regulations could be based. Several projects are underway to determine the efficiency of several different systems of waste management. Four systems are discussed which examine several aspects of feedlot waste management. These systems cover runoff collection and treatment, movement of solids on dirt lots, and various methods of loader cleaning. Rainfall, its duration and intensity is recorded for use in the analysis. 6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

A COARSE SORT SYSTEM FOR PRELIMINARY WATER RESOURCES MANAGEMENT ALTERNATIVES,
Oklahoma Univ., Norman. Bureau of Water and Environmental Resources Research.
G. W. Reid, and N. Safarik.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-260 Price codes: A09 in paper copy, A01 in microf Completion Report, July 1976. 171 p, 2 fig, 1 66 ref, 4 append. OWRT A-054-OKLA(1). I 0001-6037.

Descriptors: Water resources, *Plan *Economics, Standards, *Alternative plan Management, Lakes, *Oklahoma, Model st Methodology, *Evaluation.
Identifiers: *Arcadia Lake(Okla), *Coarse System.

The present requirements for water reso planning include the development of at leas alternative plans, one emphasizing n economic development, the other, environm quality. The inclusion of the non-quantitativ vironmental objective necessitates the dev ment of models which can deal with both qua tive and qualitative data and which prov process for eliminating infeasible alternative effecting compromises between the two c tives. The Coarse Sort System is a non-mathe cal model which provides a method for evaluating both quantitative and nonquanti data and selecting a viable plan from among natives at the preliminary planning level. Coarse Sort System requires that after alter plans are developed, they be ranked accordi how close they come to meeting the goals project. After they are ranked, they are disp on sort charts, and the process of elimin (coarse sorting), trade-off and compromis lows. The sort charts provide a simple, method for communicating information abo various alternatives to the planners and public. The Arcadia Lake project in C Oklahoma is used to illustrate the process.

Identifiers: *Multiple objective plan *Screening model, Gradient estimator, Ope rule.

A probabilistic Markov model of reservoir transitions is developed which, in combin with a simulation model, offers a computa tool for estimating response surface gradien water resources planning problems. Use o gradient estimation capability provides a sub tial improvement in efficiency of the searc improved water resources configurations. estimation capability arises by recognizing

ng the reservoir state transition changes that uld result from a modification of decision varia-s. The procedure is highly flexible in that it nctions under such complicated situations as ltiple-objective environments, nonlinear nefit loss functions, and complex connectivity river basin components. HISTORY AND DEVELOPMENT OF MULTIPLE OBJECTIVE PLANNING FOR WATER RESOURCES,
Water Resources Council, Washington, D.C.
G. D. Cobb.
In: Multiple Objective Planning for Water Resources, Volume 1, Proceedings of the UCOWR Workshop in Multiple Objective Planning and Decision-Making, Natural Resources Series Number 5, Idaho Research Foundation, Inc., Moscow, 1974. p 1-5.

Descriptors: *Water resources development, *Planning, *History, *Comprehensive planning, *River basin development, Regional development, Water quality, Decision making, *Water policy, Management, United States, *Legislation, *US Water Resources Council.
Identifiers: *Multiple-objective, Water quantity.

This article considers the role played by the Water Resources Council (WRC) and its Principles and Standards in the multi-objective planning and development of water resources. Two principal levels of planning are identified: National and regional or river basin, and characteristics of these levels are discussed. The history of water resources policy implementation from 1809 up to the National Environmental Policy Act of 1969 is traced. Finally, the WRC Principles and Standards are considered in detail, including their implementation and their influence upon the emergence of other natural resources policy considerations. EMERGING CORPS OF ENGINEERS GUIDELINES FOR IMPLEMENTING THE PLANNING REQUIREMENTS OF WRC'S PRINCIPLES AND STANDARDS AND RELATED POLICIES,
Corps of Engineers, Washington, D.C. Planning Div.
W. J. Donovan, and J. J. Jordan.
In: Multiple Objective Planning for Water Resources, Volume 1, Proceedings of the UCOWR Workshop in Multiple Objective Planning and Decision-Making, Natural Resources Series Number 5, Idaho Research Foundation, Inc., Moscow, p 9-19, 1974. 1 fig, 2 tab, 3 ref.

Descriptors: *Water resources development, *Planning, *Water policy, Methodology, Alternative planning, Environment, Quality control, Regional development, Evaluation, U.S. Water Resources Council.
Identifiers: *Multiple objective planning, Impact assessment, Social well-being.

The consideration herein is how to implement the multi-objective planning requirements of the Water Resources Council's Principles and Standards (P&S). The paper outlines the essential pol-

icy framework in which the U.S. Army Corps of Engineers proposes to implement P&S, highlights the limitations of P&S as a planning document, provides a limited, nondetailed exposition of a multi-objective planning process through plan selection and recommendation, and, finally, suggests some areas in which further research appears to be needed. The emphasis is methodological. Four functional planning tasks to be carried out during each of three stages of the planning process are identified and described: problem identification; formulation of alternatives; impact assessment; and evaluation. The impact categories, or objectives considered are national economic development, environmental quality, social well-being, and regional development. It is concluded that while there remain differences of view in high places regarding the appropriate number and content of the national objectives, acceptance of the concept of multi-objective planning as official national policy represents a substantial advance over the earlier, singular approach of economic development, the traditional objective of benefit-cost analysis. IMPLEMENTATION OF MULTIPLE OBJECTIVE PLANNING BY THE SOIL CONSERVATION SERVICE,
Soil Conservation Service, Washington, D.C. River Basin.
E. C. Buie.
In: Multiple Objective Planning for Water Resources, Volume 1, Proceedings of the UCOWR Workshop in Multiple Objective Planning and Decision-Making, Natural Resources Series Number 5, Idaho Research Foundation, Inc., Moscow, p 20-23, 1974.

Descriptors: *Planning, *Environment, *Water resources development, Water management(Applied), Regional development, Economics, Conservation, Alternative planning, U.S. Water Resources Council.
Identifiers: *Multiple objective planning, *Principles and Standards(Water Resources Council), Public participation, Environmental quality, National economic development.

The Soil Conservation Service (SCS) fully supports the concept of multiple objective planning. Since its inception in the mid-1930's, the SCS has followed this concept in all its programs. Within the last 20 years, as the programs of the SCS have become more water-management oriented, these same multiple objective concepts have guided the planning process. The SCS participated actively in the development and testing of the Water Resources Council's Principles and Standards. Discussed are limitations of the approved Principles and Standards and problems in implementation. Considered next are: The Optimum National Economic Development Plan (ONED); the Environmental Quality Plan; alternative plans; public participation; regional development; and additional needs wherein a wide range of environmental goals is needed. In conclusion the SCS fully supports the concept of multiple objective planning and has done this consistently throughout its agency life. Although it is encountering problems, several of these problems offer opportunities for research; answers or more rational procedures are essential to the effective and complete implementation of this process. PHILOSOPHY OF MULTIPLE OBJECTIVE PLANNING IN THE BUREAU OF RECLAMATION,
Bureau of Reclamation, Washington, D.C.
D. L. Porter.
In: Multiple Objective Planning for Water Resources, Vol. 1, Proceedings of the UCOWR Workshop in Multiple Objective Planning and Decision-Making, Natural Resources Series Number 5, Idaho Research Foundation, Inc., Moscow, p 23-28, 1974.

Descriptors: *Water resources development, *Planning, *Research, History, Social aspects, Evaluation, Environment, Regional development, Cost allocation, U.S. Water Resources Council.
Identifiers: *Multiobjective planning, *Principles and Standards(Water Resources Council).

This article discusses problem areas of the Water Resources Council's Principles and Standards for multi-objective planning where research would be beneficial. The paper begins with a history review and then considers plan formulation, formulation to emphasize national economic development evaluation, environmental quality evaluation, regional development evaluation, evaluation of social factors, cost allocations, and the coordination and review of planning studies. It is concluded that new or improved procedures are needed in every area that demands the characteristics of multi-objectives, externalities, social values, etc. All effects, tangible and intangible, primary and secondary, on the multi-objectives need to be evaluated and considered in planning for water resources development. THE TENNESSEE VALLEY AUTHORITY AND MULTIPLE OBJECTIVE PLANNING,
Tennessee Valley Authority, Norris. Div. of Water Control Planning.
W. G. O'Neal.
In: Multiple Objective Planning for Water Resources, Vol. 1, Proceedings of the UCOWR Workshop in Multiple Objective Planning and Decision-Making, Natural Resources Series Number 5, Idaho Research Foundation, Inc., Moscow, p 31-34, 1974.

Descriptors: *Water resources development, *Planning, *Tennessee Valley Authority, History, Economics, Decision making, Water policy, Standards, Flood control, Costs, Benefits, Environment, U.S. Water Resources Council.
Identifiers: *Multiple objective planning.

Policies and procedures for water planning have long been the subject of controversy in this country. Economists continually disagree among themselves, and many competing interests constantly question each other's motives and actions. This disagreement over the numerous theoretical and methodological issues involved is symptomtic of the fact that the subject of controversy probably involves matters of real consequences. Moreover, some key issues need resolving which involve political and policy decisions, and the controversy is unlikely to have a simple and quick solution. This article questions whether application of the Water Resources Council's Principles and Standards for multiple objective planning can be expected to improve the public decision-making process in water resource planning. Discussed are selected items from the Tennessee Valley Authority's planning background which may be useful in understanding today's situation. Described are the TVA's experience in testing the new multiple objective planning approach and plans for applying it. (See also W76-11123) (Bell-Cornell)

CONCERNS OF THE U.S. FISH AND WILDL SERVICE IN MULTI-OBJECTIVE PLANNIN
Bureau of Sport Fisheries and Wildlife, Wash ton, D.C.
G. L. Hickman.
In: Multiple Objective Planning for W Resources, Vol. 1, Proceedings of the UCO Workshop in Multiple Objective Planning Decision-Making, Natural Resources Se Number 5, Idaho Research Foundation, I Moscow, p 41-44, 1974.

scriptors: *Fish, *Wildlife, *Planning, *Water ources, Land resources, Ecology, Environ-t, Research priorities, U.S. Water Resources ncil.
ntifiers: *Multiobjective planning, *Fish and dlife Service, Principles and Standards(Water ources Council), Environmental quality, lic participation, National economic develop-t.

e U. S. Fish and Wildlife Servicebelieves that e multi-objective plan formulation occurs as a rth major phase in the planning process under Principles and Standards. To place the Na-al Economic Development (NED) and En-nmental Quality (EQ) alternative futures in spective in a given planning area, to aid in scop- each alternative, and to avoid extraneous erials from creeping into the planning process , such as those associated with Regional velopment or Social Well-being), it is believed t the study area component need should be im-diately identified as to whether they are Na-al Economic or Environmental Quality in na-e. As a second step, a separate plan should be mulated for the EQ objective, and one for the D objective. Complementary features of the osing objective should be used in formulating h plans. Only after such plans have been for-lated and the effects of each plan evaluated inst the four accounts listed in the standards uld multi-objective plan formulation be started. cussed herein are responsibilities of the Fish l Wildlife Service, aspects of environmental lity planning, public participation and input, environmental quality objective, the ecological ource component, and research needs. E USE OF MULTIPLE OBJECTIVE ANNING IN THE BUREAU OF LAND NAGEMENT,
reau of Land Management, Denver, Colo.
Fulcher.
Multiple Objective Planning for Water sources, Vol. 1, Proceedings of the UCOWR rkshop in Multiple Objective Planning and cision-Making, Natural Resources Series, mber 5, Idaho Research Foundation, Inc., scow, p 44-49, 1974.

scriptors: *Land management, *Planning, Stan-rds, Water resources, *Land use, Decision mak-, Economics, Evaluation, History, U.S. Water sources Council.
ntifiers: *Multiple objective planning, Public ticipation.

e Bureau of Land Management views multiple ective planning in a different perspective than ny other Federal agencies and institutions. It nsiders multiple use planning with its variety of ectives as synonomous with multiple objective nning; the Water Resources Council (WRC) nciples and Standards are merely evaluation cedures that can be applied to evaluating the ectiveness of its multiple use planning system. ly recently has the Bureau become seriously in-ved in trying to apply the WRC standards to luating its land management practices. It now ns to test the standards for evaluating its land nagement programs, and a team has been as-ned to test the procedures on specified activi-s in Oregon and New Mexico. It is anticipated t procedures will be developed from these tests Bureau-wide implementation of the WRC stan-rds in its planning system. This paper considers Bureau's involvement in multiple use (multiple ective) planning to date; the paper attempts to line the history of planning in the Bureau, cur-t status and components of the planning tem, and some deficiencies that have been ed. PERSPECTIVE AND ROLE OF THE ECONOMIC RESEARCH SERVICE IN MULTIPLE OBJECTIVE PLANNING,
Department of Agriculture, Lincoln, Nebr.
N. E. Landgren.
In: Multiple Objective Planning for Water Resources, Vol. 1, Proceedings of the UCOWR Workshop in Multiple Objective Planning and Decision-Making, Natural Resources Series, Number 5, Idaho Research Foundation, Inc., Moscow, p 49-52, 1974.

Descriptors: *Economics, *Research, *Agriculture, *Natural resources, *Planning, Management, Conservation, Water resources, U.s. Water Resources Council.
Identifiers: *Multiple objective planning, *Economic Research Service (U.S. Dept. of Agriculture), Principles and Standards(Water Resources Council).

This presentation brings into focus some of the potential contributions of the Economic Research Service (ERS), U.S. Department of Agriculture, in multi-objective planning for the utilization, management, conservation and development of natural resources. This is accomplished by first describing the nature of Economic Research Service (ERS) participation in natural resources planning. This is followed by a brief discussion of the perspective of ERS as it relates to planning activities. Thirdly, some problem areas in which the Economic Research Service has both an interest and analytical capability are identified. (See also W76-11123) (Bell-Cornell)

THE COST-EFFECTIVENESS APPROACH IN ANALYZING A WATER SUPPLY PROJECT FOR THE SANTA ELENA PENINSULA, ECUADOR,
Arizona Univ., Tucson. Dept.of Hydrology and Water Resources.
J. C. Villao-Yepez.
Master of Science Thesis, 1975. 90 p, 12 fig., 14 tab, 26 ref, 2 append.

Descriptors: *Cost analysis, *Economic efficiency, *Water resources development, Project feasibility, Social aspects, Dynamic programming, Water quality standards, Water shortage.
Identifiers: *Cost-effectiveness analysis, *Santa Elena Peninsula(Ecuador).

A cost-effectiveness approach is presented for analysis of a water resource project in the Santa Elena peninsula of Ecuador, an area where lack of an appropriate water supply scheme has been detrimental to population health and living standard. The area and its specific water problems are discussed along with the methodology employed. The planning process begins by identification of goals which satisfy the social, economic and physical needs of the area. A relevance-tree technique was used to classify goals and relate them to system specifications. Points covered include the selection of fixed-effectiveness, merits of alternative systems analyzed in a tabular array, sensitivity analysis of each system in achieving measures of effectiveness and choice of the most appropriate alternative. Water quality analysis is done for each system, including bacteriological and physical-chemical water quality standards. The methodology is applied using the traditional approach and recent improvements in water resource planning for developing countries. (Jahns-Arizona)

FEDERAL MANPOWER IN WATER RESOURCE ENGINEERING,
Bureau of Reclamation, Denver Colo.
E. R. Lewandowski.
Journal of the Water Resources Planning and Management Division, Vol. 102, No. WR2, p 185-192, November 1976. 1 fig, 11 ref.

Descriptors: *Water resources development, *Engineering education, *Social impact, History, Federal government, Manpower, Personnel, *Engineering personnel.
Identifiers: *Developing countries, *Manpower utilization, Population(Statistics).

There are over 20,000 water resource engineers employed by all branches of the Federal government. Forecasts indicate more will be needed in the years ahead. Their tasks are constantly changing and they are being required to adapt to amplified responsibilities in connection with the search for new and varied sources of energy in which water plays a critical role. In addition, our engineers are being asked to adopt the role of educator in training and inspiring the engineers of developing nations in order that these countries may become self-sufficient in food and power production. The ways in which formal engineering education itself should modify the traditional approach and broaden the social and political consciousness of the developing engineer and aid the

practicing professional are covered. The future requirements for Federal manpower are explored. The varied disciplines necessary to solve new problems in desalting, wastewater treatment, and weather modification are summarized. (Bell-Cornell)

Identifiers: *Graduate study, *Water plans, Civil engineers, Continuing education.

Water resources planning may be defined to include the identification and evaluation of water resources, and the planning of projects that utilize and control water. In addition to having a background in engineering subjects and physical and biological sciences related to water, the practitioner in this field should ideally be skilled or knowledgeable, or both, in economics and other social sciences, legal matters, and other aspects of planning. Basic skills that should be developed in an undergraduate program are reviewed. Informal and formal education and training following the first degree, and one graduate course in water resources are described in some detail. (Bell-Cornell)

Identifiers: *Multiple objective planning, Social welfare, Public opinion.

Present day water resources planning encompasses social, environmental, and economic objectives in developing and choosing among alternative plans. Recent efforts to operationalize multiobjective planning have engendered a variety of new techniques. Where the emphasis has been on methodological developments, this paper considers how developing methodologies relate to the water resources planning process. In terms of the basic problem of multiobjective analysis, the function of the planning process is seen as integrating technical information from the planning team and social value information from the publics to arrive at a socially preferred alternative. A model of this process is presented and some desired attributes of multiobjective methods to support the process are identified. Several classes of multiobjective methods are described and compared as to their implementation requirements and their characteristics relative to both technical and value aspects of the planning process. Discussed are: visual techniques; rating and ranking methods; matrix and linear scoring methods; tradeoff displays and analysis; multiobjective programming; goals evaluation techniques; and iterative methods. NONQUANTITATIVE METHODS IN WATER RESOURCES MANAGEMENT,
Louisville Univ., Ky. Systems Science Centre.
R. K. Ragade, K. W. Hipel, and T. E. Unny.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. WR2, p 297-309, 4 fig, 4 tab, 11 ref.

Descriptors: *Water resources, *Management, *Aesthetics, Optimization, *Planning, Methodology, Decision making, Evaluation, Social needs, Equations, Systems analysis, Algorithms, Water demand, Recreation.
Identifiers: Quantitative analysis, *Nonquantitative methods, Aesthetic properties, International pollution conflict.

In water resources planning, problems often arise where consideration must be given to intangible variables. If 'quantitative' optimization techniques are used, assigning numeric values to the intagibles usually fails to account for them satisfactorily. Furthermore, quantifying such factors can be classed under 'unnatural' methods of analysis. This is particularly true in humanistic and societal decision making, where one has to make many kinds of ethical and value judgments. Quantitative optimization methods though precise, become difficult to justify unless supplemented by subjective and other criteria. This paper examines the aforesaid problems and surveys alternative methods of analysis based upon 'nonquantitative' (i.e., 'non-numeric' and 'quasi-numeric') considerations of the variables. These method include fuzzy set theory, metagame analysis, and pseudoboolean methods. In conclusion, recent developments in non-numeric methods show promise for handling system design problems where intangibles need to be systematically accounted for and evaluated. (Bell-Cornell)

'APPROACHES TO MULTI-OBJECTIVE PLANNING IN WATER RESOURCE PROJECTS,' BY BERNARD W. TAYLOR III, K. ROSCOE DAVIS, AND RONALD M. NORTH,
Cornell Univ., Ithaca, N. Y. Dept. of Environmental Engineering.
L. M. Falkson.
Water Resources Bulletin, Vol. 12, No. 5, p 1071-1077, October 1976. 1 fig, 15 ref.

Descriptors: *Water resources, *Project planning, *Economics, *Systems analysis, Linear programming, Optimization, Simulation analysis, Algorithms, Benefits, Costs, Measurement, Reservoirs, Storage, Mathematical models.
Identifiers: *Multi-objective planning, Penalty costs, Goal programming, Minimization, Benefit maximization, Water uses.

One of the approaches to multiple objective planning in water resource projects discussed by the authors in this paper is goal programming. The purpose of this note is to comment upon the similarity and differences between the goal programming framework and the short-run loss function-target output concepts which appear in much of the water resource literature on the application of mathematical programming and simulation to water resources project design and operation (Maass, et al., 1962; Hufschmidt, 1963; Hufschmidt and Fiering, 1966; and Loucks, 1969). Mathematically, the incorporation of piecewise linear loss functions into a water resource system model is equivalent to goal programming. However, the economic interpretation of the two approaches is quite different. From the standpoint of theoretical welfare economics, there are only t
basic objectives, economic efficiency, and equ
in the distribution of income. (See also W76-013

South Africa's phenomenal economic growth over the last few years has brought with it a steeply rising demand for power. To meet this demand, South Africa's Electricity Supply Commission (ESCOM) has embarked upon a vigorous expansion programme and several new thermal power stations are being built in the Eastern Transvaal. The commissioning of these new units, however, will greatly increase ESCOM's water supply requirements. This paper, presented at the recent Cape Town conference on 'Energy and its future in Southern Africa' analyses the problem and offers some solutions. Dry cooling is explained and reasons are presented why (at present, at least) ESCOM wishes to defer large-scale adoption of dry cooling for as long as possible. Water yield from possible dam sites in all the major rivers of the Eastern Transvaal and extreme Northern Natal are investigatd. (South Africa)

Identifiers: *South Africa, *Crocodile River, Roodekopjes Dam.

The Department of Water Affairs is planning to build a dam on the Crocodile River near Brits. The Roodekopjes Dam, as it will be called, will help considerably in meeting water requirements for mining and industrial development, domestic usage and agriculture in the area. The dam will comprise an earth embankment with a gated concrete spillway and will cost in the region of R5,580,000. Existing dams in the area include the Kliproos, Vaalkop and Bospoort dams and the Department of Water Affairs is planning to operate these and Roodekopjes as a single unit in order to give the maximum advantage from them. Identifiers: *Coastal zone management, *Coastal waters.

Current demographic projections estimate that 80% of the population will live within 50 miles of the United States coastline by the year 2000. Protection of the ecological systems in these areas is necessary and could be achieved through reservation of permanent preserves or sanctuaries. The author discusses legislation enacted for the protection of marine sanctuaries by Florida, Massachusetts, Hawaii and California. Estuarine sanctuaries for research purposes have been set aside in Maine, Illinois, Wisconsin, Indiana, Ohio, Minnesota, and Florida. Problems which may arise in the establishment of a state sanctuary include conflicts with international law because of the 3-mile limit; jurisdictional conflicts between state and federal government where federal and state sanctuaries are contiguous; conflicts between the state and various federal regulatory agencies; and the question of compensation for private owners within a sanctuary area. Specific recommendations are made for the establishment and management of marine and estuarian sanctuaries. (Capehart-Florida)

Identifiers: *Coastal waters, *Tuna, Fishing industry, Licenses.

The concept of a 200-mile exclusive economic zone to protect coastal fisheries was discussed at the 1974 Law of the Sea Conference. The United

States is considering unilateral declaration of such an economic zone. Although the U.S. zone would exempt highly migratory fish species, the tuna industry asserts that this exception would go unnoticed by other countries who would then extend their own jurisdictions without the migratory exclusion. The effect of such a zone on the U.S. tuna industry would be disastrous. The tuna fishing techniques are shallow-water oriented with 80% of the Pacific tuna catch inside 200 miles of the Latin American coastal waters and 100% of the Atlantic catch within 200 miles of African waters. Destruction of the tuna fishing and processing industry would have significant national economic impact and a crippling economic effect in Southern California, Puerto Rico, and American Samoa. While concluding that world-wide cooperation through an international treaty would be the most effective solution, the author suggests use of force, negotiation or purchase of fishing rights, limited international agreement, and domestic legislation as alternative solutions to the problem. (Capehart-Florida)

RECENT DEVELOPMENTS IN THE LAW OF THE SEA: A SYNOPSIS,
R. G. Pickering, and W. W. Taylor.
San Diego Law Review, Vol 13, p 628-666 (1976), 38 p.

Descriptors: *Law of the sea, *Conservation, *Water pollution control, *Natural resources, *International law, Legal aspects, Conferences, Pollution, Ships, Jurisdiction, Manganese, Marine fisheries, Oil spills, Offshore platforms, Canals, Migration, Protection, Water pollution, Panama Canal, Research and development, Oceans, Ownership of beds, Continental shelf.
Identifiers: *Ocean dumping, *Ocean resources, *Thermal energy, Suez Canal, Tuna, Economic zones.

The second substantive session of the Third United Nations Law of the Sea Conference was held in Geneva in 1975. The major concerns of the conference included the following: (1) the development of a system for managing the exploration and exploitation of deep seabed resources; (2) an extension of the territorial sea from 3 to 12 miles; (3) establishment of an exclusive economic zone of 200 miles; (4) the establishment of guidelines for scientific research; and (5) the protection of the marine environment. Othe recent law of the sea developments are summarized under specific headings. The conservation area deals mainly with fishing quotas. The fishing category includes jurisdictional agreements and disagreements as to economic zones. The discussion of pollution and pollution control is divided into international, federal, and state subcategories with the main emphases on oil spills and ocean dumping. The seabed resources area covers oil leasing, manganese nodule mining, and ocean thermal energy. The category of shipping includes the United Nations Draft Convention on Shipping, the United States Deepwater Port Act of 1974, and information on the Suez and Panama Canals. The final area of sovereignty includes federal sovereignty over the Atlantic Continental Shelf and over certain Alaskan submerged lands. (Capehart-Florida)

OFFSHORE BOUNDARIES: ENGINEERING AND ECONOMIC ASPECTS,
National Ocean Survey, Rockville, Md.
H. Orlin.
Ocean Development and International Law Journal, Vol 3, p 87-96 (1975). 10 p, 1 fig.

Descriptors: *International law, *Law of the sea, *Boundaries(Property), *Continental shelf, Continental slope, Submarine canyons, Sedimentation, Geomorphology, Marine geology, Oceans, Sound waves, Sounding, Data collections, Maps, Surveys.
Identifiers: *Coastal waters, *Contiguous zones.

Aside from political and economic considerations, the setting of national and economic offshore boundaries presents some very practical problems. Boundary setting invalues three aspects: delimitation, demarcation, and recovery. Delimitation is the agreement as to boundary definition. Demarcation actually establishes the location of the boundary and recovery refers to returning to or physically recognizing the boundary. Demarcation and recovery present certain technological difficulties with regard to the sea. If boundaries are established in terms of distance from baseline no major problems are involved once such baselines are established. Determination of boundaries in tems of depth, slope-rise intersection, or oceanic-continental crust intersection, however, require use of equipment for acoustical or echo measuring; and data in existence regarding ocean floors is not always accurate or complete. In addition, some demarcations are more clear than others in various areas of the world. All in all, international consideration of the problems involved beforehand can prevent years of future dispute. (Comer-Florida)

OWNERSHIP ON NAVIGABLE WATERBOTTOMS--CALIFORNIA COMPANY V PRICE REVISITED,
F. J. Crosby.
Louisiana Law Review, Vol 36, p 694-704 (Winter 1976), 11 p.

Descriptors: *History, *Louisiana, *Judicial decisions, *Ownership of beds, *Beds under water, Legal aspects, State governments, Beds, Boundaries(Property), Navigable rivers, Navigable waters, Streambeds, Riparian rights, High water mark, Low water mark.

Examined here is whether a state or private entity holds title to beds of navigable waterways. The question arose in Louisiana, where the Louisiana Supreme Court held in 1954 in California Co. v Price that private ownership of such beds is permissible under state law. The court re-examined the same question in 1975, however, and reversed itself in Gulf Oil Corp. v State Mineral Board. It was held that 'patents purporting to convey the beds of navigable waterways in Louisiana are ineffective'. A short history is given of the development of waterbottom ownership rights in America, as well as of the common law notion of implied sovereignty, which dates back to medieval England. ntifiers: *Environmental impact statement, ational Environmental Policy Act, Administra-e regulations.

e Army Corps of Engineers has, in the past, ed economic cost-benefit justifications for many its projects. This method is coming into estion as economists and environmentalists ound the nation challenge what they contend are ccurate analyses by the Corps. These analyses ce went without scrutiny, but now the whole ocess of construction has been slowed by the ssage of the National Environmental Policy Act 1970 (NEPA). The Corps is required to file an vironmental impact statement (EIS) for each nstruction project, and hearings are now man-ted at every stage of the planning process. This s given environmentalists time to mobilize facts, ures, and the public against agressive water nstruction projects. Nevertheless, it is estionable whether an unfavorable EIS state-nt can effectively prevent projects where there no environmentally safe way to build. In addi-n, it is unlikely that EIS's will have any impact yond the particular project since different sec-ns of the country feel differently about the onomic and environmental aspects of construc-n. Thus, until Congress mandates otherwise, the st-benefit analysis will remain a prime factor in stifying Corps projects. (Frank-Florida)

ORELAND REGULATION IN WISCONSIN,
sconsin Dept. of Natural Resources, Madison.
Lauf.
astal Zone Management Journal, Vol 2, No 1, p 58 (1975). 12 p, 1 fig, 8 ref.

scriptors: *Comprehensive planning, *Share otection, *State governments, *Wisconsin, Per-ts, Water resources, Legal aspects, Zoning, cal governments, Regulation, Shores, Short-m planning, Long-term planning, Lakes, Ponds, eams, Floodplains.
ntifiers: *Water Resources Act of 1966, dministrative regulations.

sconsin's enormous lakefront land area has en used since the 1900's for recreation and for ch unplanned development. In order to curb the ulting environmental damage as well as provide local control of local property, the legislature ssed the Water Resources Act of 1966. The bill ables counties to zone all unincorporated areas ng 1000 feet landward of lakes, ponds, and wages, and to zone 300 feet landward of eams, or the landward side of the floodplain, ichever is greater. In addition, the state also veloped standards and criteria for sanitary trictions and subdivision regulations. These wers have, for the first time, given localities ntrol of those areas closest to them. Developers ght the bill and challenged it in court after its ssage. However, the Supreme Court in Just v. rinette County affirmed the concept of specific oreland regulation and special permit hniques. Thus, local governments now have the wer whether they will use it wisely in formulating rational, planned decisions remains to be seen. (Frank-Florida)

PUBLIC RIGHTS TO ARTIFICIAL WATER-BODIES IN FLORIDA,
Florida Univ., Gainesville. School of Law.
M. Nelson.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, for $1.30. (1976), 25 p.

Descriptors: *Public rights, *Florida, *Artificial lakes, *Artificial watercourses, Impoundments, Riparian rights, Land tenure, Navigable waters, Non-navigable waters, Prescriptive rights, Easements, Canals, Recreation, Judicial decisions, Legal aspects, Public access, Navigation, Recreation demands, Social aspects, Reservoirs.
Identifiers: *Public trust doctrine, Navigability tests.

Under Florida law, public rights attach to navigable waters. The increasing need for state control of artificially created bodies of water for recreational and environmental purposes raises the question of whether public rights may be attached to artificial waters. When navigable waters are artificially enlarged or improved, the right of navigation is not limited to the original channels. Public rights, however, do not attach to non-navigable waters made navigable by private landowners. Riparian rights also do not attach to artificial bodies of water but they may be attached through claims of easements, permissive use, dedication, or reservation in deed. Public rights may also be asserted by use of the same doctrines as well as through a claim of recreational navigability. Although not yet accepted in Florida, the recreational use test of navigability may evolve into a means to assert a public claim to artificial waters. The author concludes that increasing public claims on artificial waters may lead to a change in the common law approach. (Capehart-Florida)

UNITED STATES STEEL CORPORATION V SAVE SAND KEY, INC.: A LOSING BATTLE IN THE FIGHT FOR FLORIDA BEACHES,
Florida Univ., Gainesville. School of Law.
T. Mariani.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $1.20. (1976), 28 p.

Descriptors: *Common law, *Florida, *Beaches, *Public access, *Public rights, Land tenure, Population, Legal review, Islands, Coastal structures, Recreation, Prescriptive rights, Judicial decisions, Legislation, Right-of-way, Protection, Social aspects, Oregon, California.
Identifiers: *Standing(Legal), *Nuisance(Legal aspects), Injunctive relief, Prescriptive easements.

Only 277 of the 6,265 miles of Florida beaches are publicly owned. The rapidly expanding population of the state gives rise to a need for the preservation of public beaches and for the establishment of public rights in private beaches. Through use of the unsuccessful litigation by Save Sand Key, Inc., a citizen's group, the author examines the legal theories employed by plaintiffs to establish public rights. The claim of public acquisition of a prescriptive easement is one that is severely restricted by Florida's conservative courts and is seldom successful. Implied dedication of public rights, successfully used in California, is another doctrine which has problems in Florida because of the requirement of proving the intention to dedicate. The English doctrine of custom, used in Oregon to preserve large areas of beach has been accepted by Florida courts. This doctrine, however, was never applied to the Save Sand Key case since the suit failed under a nuisance theory for lack of standing. The author decries the failure of the government to protect Sand Key and concludes that legislation permitting public interest suits for beach protection is necessary. (Capehart-Florida)

THE DEVELOPMENT AND IMPLEMENTATION OF THE COASTAL CONSTRUCTION SETBACK LINE LAW,
Florida Univ., Gainesville. School of Law.
W. M. Sensabaugh.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, for $2.25. (1973), 45 p, append.

Descriptors: *Construction, *Coasts, *Florida, *Beach erosion, *Beaches, Oceans, State governments, Environmental effects, Environmental control, Environment, Erosion, Shore erosion, Dunes, Sands, Seashores, Legislation, Legal aspects, Administrative agencies.

In Florida there has been little corporate concern with the problems of beach-front development. In response to a growing interest in beachfront protection, Florida passed the Coastal Construction Setback Line Law. This legislation makes it unlawful to excavate, or to construct any structures within 50 feet of the mean higher water line (MHWL) without first obtaining a permit from the State Department of Natural Resources. This 50 foot limit is hard to administer and enforce, however, because it is difficult to determine accurately the MHWL. Also, the measurement must be taken on the day the owner begins construction, because the owner may in good faith have miscalculated, and a later measurement could put him in violation of the law. Finally, topographic and engineering studies will be required for much of Florida's coasts. Beach changes must also be taken into account. (Frank-Florida)

SOME WATER LAW PROBLEMS ASSOCIATED WITH ESTERO BAY, FLORIDA,
Florida Univ., Gainesville. School of Law.
W. H. Harrell.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, for $1.75. (1974), 35 p.

Descriptors: *Florida, *High water mark, *Tidal marshes, *Mangrove swamps, *Grasses, *Boundaries(Property), Shallow water, Salt marshes, Berms, Geomorphology, Water level fluctuations, Seashores, Banks, Ownership of beds, Aquatic plants, Soil-water-plant relationships, Water requirements, Amphibious plants, Aquatic weeds.
Identifiers: Coastal waters, Coastal zone management, Presumptions(Legal), *Estero Bay(Fla).

Stretches of Florida's coastlines, such as the Estero Bay area, present special problems in relation to private and public property determinations. Estero Bay is a protected area not subject to normal wave action and thus has no berms except those caused by storm. The coastal areas of the bay, however, are thick with vegetation making measurement of the mean high water mark difficult and expensive. The prevailing law of state property determination is that if the mean high water mark cannot be determined the federal meander line can be used. The law may have unfortunate results, because often the meander line bears no resemblance at all to the mean high water mark. Estero Bay, like all other vegetated coastal areas, presents its own set of indicators of boundary. The vegetation can be divided into that growing above and that growing below the high water mark. Vegetation will not pinpoint the precise boundary but it can still be used to avoid grossly inaccurate determinations. (Comer-Florida)

LEGAL CONSIDERATIONS CONCERNING OYSTER CULTIVATION IN FLORIDA,
Florida Univ., Gainesville, School of Law.
R. H. Rex.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, for $2.75. (1976), 55 p.

Descriptors: *Florida, *Oysters, *Shellfish farming, *Leases, Legislation, State jurisdiction, Federal jurisdiction, Rivers and Harbors Act, Submerged Lands Act, Administration, Regulation, Riparian rights, Permits, Water resources development, Aquiculture, Legal aspects, Water law, Commercial shellfish, Commercial fishing, Crustaceans, Invertebrates, Fishing gear, Fish harvest.
Identifiers: Coastal waters, Coastal zone management, Navigation obstructions, Water rights(Non-riparians), Licenses.

Oysters in the submerged lands of Florida belong to the state in public trust by virtue of the federal Submerged Lands Act. Control of submerged bottom lands and their associated resources is vested in the Division of Marine Resources of the Department of Natural Resources. The law of Florida allows leasing of such resources in accordance with statutory requirements. Two types of leases are available: the lessee may obtain rights only to the submerged bottom land, or he may obtain rights to the bottom and to the water column above. Both leases are limited to the extent of use necessary to accomplish the purpose of the lease. Besides compliance with Florida law and administrative regulations, a lessee must consider federal jurisdiction. In addition, boundary markers of all leased areas must comply with Coast Guard regulation. The Army Corps of Engineers may become involved if obstruction to navigable waters is contemplated. The Corps involvement is most likely in event of aquicultural leases, which include the water column above bottom. (Comer-Florida)

TIDAL BOUNDARIES IN FLORIDA,
Florida Univ., Gainesville.
J. L. Reinman.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, for $1.35. (1974), 27 p.

Descriptors: *Florida, *Ownership of beds, *High water mark, *Meanders, *Banks, *Boundaries(Property), Tidal waters, Water levels, Water level fluctuations, Tidal effects, Variability, Coastal marshes, Tidal marshes, Mangrove swamps, Freshwater marshes, Wetlands, Navigable waters, Riparian rights, Real property, Water law.
Identifiers: Coastal waters, Coastal zone management.

Florida law dictates that the boundary line between privately owned uplands and state owned submerged lands along navigable waterways is the 'ordinary high water mark'. A problem of definition results from use of this term, however, because earlier cases in Florida, as well as in other states, have defined the mark in terms of neap tide high water. The federal definition of 'ordinary high water', on the other hand, is determined as the mean high water of all tides, spring as well as neap. Current usage in Florida indicates an adoption of the federal definition, although no definitive statement to that effect has been presented by the courts. A further complication of the high water mark as boundary question is the occasional use of the federal meander line as a boundary. Technically the meander line boundary applies only to swamp and wetlands that are not navigable. The Florida courts, however, use the meander line when navigable waters are bordered by marsh so as to make the high water mark impossible to determine. (Comer-Florida)

FEDERAL REGULATION OF DEVELOPMENT IN FLOOD-PRONE WETLANDS--THE ARMY CORPS OF ENGINEERS,
Florida Univ., Gainesville. School of Law.
R. B. Heyward.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, for $0.90. (1975) 18 p.

Descriptors: *Land use, *Flood control, *Regulation, *Federal jurisdiction, *Flood plain insurance, Flood plain zoning, Legislation, Flood plains, Flood protection, State jurisdiction, Flood damage, Non-structural alternatives, Flow control, Floodway, Watershed management, Channel improvement, Administrative agencies, Federal government, Permits, Administrative decisions, Adoption of practices.

The Federal Flood Disaster Protection Act of 1973, together with the National Flood Insurance Act, provides flood protection through combining land use regulation and insurance. The federal program is not entirely effective, however, since 11,000 of the near 15,000 eligible communities had not qualified for insurance protection as of 1974. These flood-prone communities exemplify the need for alternative flood control measures. One alternative is the use of the Army Corps of Engineers as a regulating agency exercising jurisdiction in the area of flood control. The Corps was originally granted jurisdiction over channel and watershed drainage improvements under the Flood Control Act of 1944. The jurisdiction was enlarged to include land use planning under the Watershed Protection and Flood Prevention Act. To date the Corps has limitedly exercised jurisdiction, and no congressional mandate requires the Cors to act. In fact the federal insurance program seems to support the Corps' reluctance. Thus, if insurance is ineffective, other measures are required. (Comer-Florida)

A STUDY OF VARIOUS STATE FLOOD PLAIN REGULATIONS IN AN EFFORT TO EMPHASIZE FLORIDA'S NEED TO EXACT COMPREHENSIVE PLANNING AND LAND USE CONTROLS, WHICH ARE DESIGNED TO AFFORD PROTECTION AGAINST HURRICANE DAMAGE,
Florida Univ., Gainesville. School of Law.
R. Herold.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, for $1.35. (1974), 27 p.

Descriptors: *Florida, *Hurricanes, *Flood damage, *Southwest U.S., *Flood plain zoning, Arizona, Utah, Nevada, Texas, California, Hurricanes, Shore protection, Coastal structures, Land use, Building codes, Legislation, Regulation, Safety factors, Buildings, Standards, Permits, Legal aspects.

Florida has had, in the last 25 years, massive coastline development. As yet, none of the recent construction has been tested by a '100 year flood' or even by very severe hurricanes such as those of the 1920's and 1940's. The state must, to protect all of its inhabitants, formulate and implement a flood plain planning program to prevent excessive construction in flood prone areas and to protect the beach dune areas which provide protection from hurricanes. Nevada, Arizona and Utah, have recently enacted such flood plain planning programs aimed at increasing protection from and conservation of flood waters. The needs of these states, however, are very different from Florida's needs. California and Texas have implemented programs for protection of coastal communities. Texas' program is of special interest to Florida because Texas is also prone to hurricane damage. Unlike Florida, Texas has received recent severe flood damage. Florida should take heed and establish comparable protection before similar harm is done. (Comer-Florida)

struction material, Flood damage, Legislati
Regulation, Safety factors, Permits, Land u
Buildings, Standards, Legal aspects.

One of the most controversial methods of fl
plain management is land use regulation. T
method is also the most effective managem
plan. Flood plain zoning which prevents consti
tion of all or of certain types of buildings runs
greatest risk of constitutional challenge. Flo
has yet to consider the issue but court reactio
prohibitive zoning in other states has been mi
Serveral such ordinances have been found to
unconstitutional takings. Another measure wh
is less open to the taking argument is use of bu
ing codes. If this measure is adopted the
really effective program would have to incl
codes requiring alteration of existing structure
well as construction regulations for new st
tures. Building codes are subject to equal pro
tion challenges. Furthermore, the finan
problems, particularly with regard to exis
structures, may be immense. Such difficulties
be overcome, however, and such program h
had good results where implemented. (Con

URBAN STORM WATER RUNOFF: A TW
FOLD PROBLEM,
Florida Univ., Gainesville. School of Law.
D. Fernandez.

vailable from Eastern Water Law Center, niversity of Florida, Gainesville, Florida 32611, r $2.45. (1976), 49 p.

escriptors: *Storm runoff, *Cities, *Storm ains, *Urbanization, *Surface runoff, Storm ater, Water pollution sources, Riparian rights, rplus water, Depression storage, Impoundents, Ponding, Retention, Watershed manageent, Surface groundwater relationships, Water w, Legal aspects, Constitutional law.

torm water runoff is a serious problem in urban eas and may constitute a significant source of ater pollution. The solution to storm water ruoff difficulties seems to be the detention of aters in higher lands for longer periods, coupled ith drainage improvements in lower areas. Detntion of water in upper land areas, however, inolves the possibility of constitutional taking of roperty. In addition, increased drainage on lower nds often requires costly acquisitions of flood sements over private property. Flood insurance gislation has led to a new awareness of flood ain zoning, and the local responses indicate that e problems can be solved. Flood water pollution another matter. Zero pollution goals prevent ruoff into waterways but detention of water often sults in pollution of groundwater. Probably chnological advances will provide a solution. Comer-Florida)

HE NATIONAL FLOOD INSURANCE ACT OF 968 AND FLOOD PLAIN ZONING IN ARKANAS, NEBRASKA, NORTH DAKOTA, MISSISPPI, TENNESSEE, SOUTH DAKOTA, AND ANSAS,
lorida Univ., Gainesville. School of Law.
A. Rasmussen.
vailable from Eastern Water Law Center, niversity of Florida, Gainesville, Florida 32611, r $1.60. (1976), 32 p.

escriptors: *Central US., *Design standards, Flood control, *Federal government, *Flood ain zoning, Nebraska, North DAkota, Mississip, Tennessee, South Dakota, Kansas, Legislaon, State jurisdiction, Flood data, Flood damage, lood plain insurance, Flood plains, Land use, uilding codes, Foundations, Safety factors, egulation, Permits, Legal aspects.

he National Flood Insurance Act of 1968 is esntially a voluntary program. Communities and ates wishing to take advantage of the Act must ow that flood control programs meeting inimum federal standards have been impleented. The various states have faced flood conol in different ways. Arkansas, for instance, prodes by statute that each community may enact gislation. If local laws fail to meet federal quirements, however, the state may provide ricter standards. Nebraska has provided its comunities with minimum standards and model ornances all complying with federal law. North akota allows farm buildings in flood plain areas hile Mississippi does not. North Dakota's law is, erefore, federally in-adequate and dangerous. omparison of the above plans with those of other ates such as Tennessee, South Dakota, and Kans shows the strengths and weaknesses of each d may suggest the best method to be used by her states. (Comer-Florida)

EDEVELOPMENTS ON THE OCEANFRONT,
orida Univ., Gainesville. School of Law.
. A. Pope.
vailable from Eastern Water Law Center, niversity of Florida, Gainesville, Florida 32611, r $2.40. (1976), 48 p.

escriptors: *Permits, *Florida, *Hurricanes, igh water mark, *Structures, Tides, Coasts, uildings, Construction, Riparian rights, Accretion(Legal aspects), Erosion, Avulsion, Beds, Damages, Watercourses(Legal aspects), Tidal waters, Ownership of beds, Boundaries(Property), Navigable waters, Coastal structures.
Identifiers: Public trust doctrine.

Private ownership of oceanfront property carries certain rights and restrictions as regards development of the property. Once the property has been developed, the question may arise as to whether such development may be restored if it is partially or wholly destroyed. The author examines the issues involved in Florida in rebuilding structures damaged or destroyed by hurricanes, including the problem that arises when the mean high water line has been moved shoreward of the structure by tidal action. The applicable state and federal laws are reviewed and pertinent case decisions are discussed. Various arguments open to the land owner are examined. In most cases permission to rebuild would depend on a combination of factors, including nearness to the mean high water line, the possible environmental damage, and the potential for interference with public rights. WATER MANAGEMENT AND ADMINISTRATION IN THE SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT,
Florida Univ., Gainesville. School of Law.
C. Hardee.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, for $3.70. (1976), 74 p, 7 tab, 1 fig, 3 append.

Descriptors: *Water management(Applied), *Florida, *Well regulations, *Well permits, Wells, Legislation, Administrative agencies, Water use, Water law, Drilling, Water sources, Water resources, Water resources development, Permits, Groundwater, Groundwater resources, Groundwater potential, Management.
Identifiers: *Florida Water Resources Act of 1972.

A landowner faces many problems in building a water well field for municipal supply. Specifically, the landowner is concerned with possible legal consequences of the lowering of lake and ground water levels which may result from his pumping activities. As a preliminary guide to understanding the problem, background principles of groundwater hydrology and geology are given in condensed form. The common law development of groundwater rights is then examined, as well as statutory modifications of that doctrine in Florida. Special emphasis is placed on the water management policies of the Southwest Florida Water Management District (SWFWMD) and on the rules and regulations of the Florida Water Resources Act of 1972. To provide a brief overview of SWFWMD administrative procedures, a case study in water management and administration is presented, using the District's rules and regulations as parameters for a well construction problem. Finally, a sample application package for SWFWMD consumptive use permits is presented.

COASTAL CONSTRUCTION AND OTHER PHYSICAL ACTIVITIES SEAWARD OF THE MEAN HIGH WATER LINE,
Florida Univ., Gainesville. School of Law.
T. Tomasello.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, for $3.70. (1976), 74 p, 3 fig, 2 append.

Descriptors: *Landfills, *Construction, *Florida, *Dredging, *Permits, Coasts, Erosion, Shore protection, Tidal effects, Waves(Water), Seashores, Oceans, Sand bars, Sand spits, Legislation, Beach erosion, State governments, Local governments.
Identifiers: *Coastal zone management, *Coastal waters, *Licenses.

Florida and federal legal problems associated with two different types of proposed coastal construction are explored, with the emphasis placed on state regulation. A hypothetical situation is posed in which a hotel owner wishes to increase his beach area by either constructing a groin or extending his upland seaward by means of dredging and filling. The complexities of such an operation have grown considerably in that government has become more concerned with the coastal environment. To illustrate this increased government involvement, a history of Florida regulations concerning coastal lands, as well as a discussion of the trust doctrine and the interpretation of 'public interest' is presented. Regulatory schemes presently in force in Florida are also discussed. They are broken down separately to cover groin construction and dredge and fill activities. Today in Florida as many as nine state and federal permits may be required for the project. However, because the hotel owner will probably not be able to demonstrate that the construction will benefit the public interest, it is unlikely that the permits will be issued. (Frank-Florida)

COMMISSION FOR OCEAN ADVANCEMENT THROUGH SCIENCE AND TECHNOLOGY.
Alas Stat Ann secs 46.26.010 thru 46.26.100 (1971).

Descriptors: *Water resources development, *Administrative agencies, *Alaska, *Water allocation(Policy), *Project planning, Beneficial use, Water pollution control, Water quality, Water supply, Regulation, Programs, Project feasibility, Social function, Water management(Applied), Environmental effects, Legislation, Environmental control, Project purposes, Local governments, Social impact, Alternative planning.

Alaska has enacted legislation creating in the Office of the Governor the Commission for Ocean Advancement Through Science and Technology. The Commission's purpose is to develop a comprehensive state plan for the orderly, long range conservation and development of marine and coastal resources. This will ensure their wise multiple use in the public interest. Commission members are empowered to implement the plan. To begin, the Commission shall undertake a comprehensive investigation and study of all aspects of the marine sciences and the marine and coastal environment in and proximate to the state, including: (1) a review of the known and estimated future needs for natural resources from the marine and coastal environment; (2) a survey of all significant existing and planned marine science activities in the state; (3) a determination of what the state policies, programs and laws should be regarding all social, economic, and legal matters relative to the conservation and utilization of ocean resources; and (4) a determination of the surveys, applied research programs and ocean engineering projects required to obtain the needed natural resources from the marine and coastal environment. (Lauer-Florida)
W77-01103

COMMISSION ON THE CONFERENCE OF THE LAW OF THE SEA.
Alas Stat Ann secs 44.19.789 thru 44.19.799 (1967).

Descriptors: *Alaska, *Resources development, *Natural resources, *Legislation, *Law of the sea, Conferences, State governments, Mineralogy, Oil, Natural gas, Fish, Shellfish, Administrative agencies, Jurisdiction, Legal aspects, Grants, Beds, Coasts, Oceans, Governmental interrelations, State jurisdiction, Conservation.

The Alaska legislature has created a seven member commission on the Conference of the Law of the Sea. The commission has the responsibility for compiling and analyzing data on resources in the sea or seabed off the Alaskan coast. It is also charged with development of state

positions on management, utilization and conservation of marine resources such as minerals, oil and gas, and fish and shellfish. It is also charged with the establishment of maximum jurisdictional limits for the state. The commission has a further duty of assuring fair representation for the state in the 1973 Conference on the Law of the Sea and subsequent conferences. The commission is also authorized to enter into agreements with other coastal states for the development and conservation of marine resources. (Capehart-Florida)
W77-01104

PUBLIC LANDS (LEASING OF MINERAL RIGHTS IN STATE OWNED TIDAL AND SUBMERGED LANDS).
Alas Stat Ann secs 38.05.250 thru 38.05.255 (1973).

Descriptors: *Alaska, *Mining, *Beds, *Permits, *Leases, Exploration, Mineralogy, State governments, Administrative agencies, Mills, Rent, Timber, Mine wastes, Ownership of beds, Bids, Contract administration, Legal aspects, Legislation, Contracts, Tidal marshes.
Identifiers: *Tidelands.

The right to explore tide and submerged state lands for minerals may be granted by a permit. The maximum area of exploration is 2,560 acres with rental paid on a per acre basis. Such rental may be offset by useful expenditures on the permitted land. Under a prospecting permit, limited amounts of minerals may be mined for purposes of sampling and testing. If minerals are discovered, the permit holder may acquire a non-competitive mineral lease for that portion of the permitted land shown to contain mineral deposits. Submerged lands containing known deposits may be leased by competitive bids. Mineral leases are for a maximum term of 55 years with a yearly rental of $1/acre adjustable every 20 years. Surface uses of land or waters by the owner of the mineral rights shall be limited to those uses necessary to exploration, mining, or processing. Permits may be granted for millsites and tailings disposal. (Capehart-Florida)
W77-01105

PUBLIC LANDS (PREFERENCE RIGHTS ESTABLISHED FOR ACQUISITION OF TIDELANDS AND SUBMERGED LANDS).
Alas Stat Ann secs 38.05.320, 38.05.365 (1973).

Descriptors: *Alaska, *Preferences(Water rights), *Boundaries(Property), *Ownership of beds, Public access, Priorities, State governments, Cities, Beds, Seashores, Tidal waters, Leases, Right-of-way, Navigation, Real property, Land tenure, Legislation, Legal aspects.

The Alaska legislature is establishing preference rights for the acquisition of tidelands and submerged lands occupied or developed prior to the date of statehood. Cities may apply for a conveyance from the state of submerged lands seaward of the city. Preference rights are classified for occupants of land conveyed to the cities by the state. Cities conveying submerged lands to occupants shall convey additional unoccupied land where reasonably necessary for the use and enjoyment of the occupied land unless development of the land would interfere with navigation. Cities may sell or lease tidelands if no preference right has been granted for them. Rights-of-way shall be reserved if necessary to provide access to public waters. Preference rights are classified for occupants of submerged lands not seaward of a city. (Capehart-Florida)

UNITED STATES V KAISER AETNA (DEVELOPMENT CHANGING NATURE OF POND FROM PRIVATE TO SUBJECT TO PUBLIC NAVIGATION SERVITUDE).
408 F Supp 42-55 (D Ha 1976). 14 p.

Descriptors: *Hawaii, *Judicial decisions, *Navigabile waters, *Public access, Easements, Public rights, Excavation, Construction, Landfills, Riparian rights, Navigation, Rivers and Harbors Act, Federal government, Water law, Permits, Control, Legal aspects, Water policy, Water rights, Legislation.
Identifiers: *Water rights(Non-riparians), *Navigational servitude.

Plaintiff United States sought a declaratory judgment that the waters of defendants' pond, generally known as Hawaii-Kai Marina, were navigable waters of the United States and that defendants were, therefore, required to obtain authorization for any construction, excavation, or filling. Plaintiff also sought an injunction to prevent the defendants from interfering in any way with public access to the waters of the marina. The U. S. District Court held that fishponds in Hawaii are of a private nature, and ownership of such ponds includes the right to exclude the public. However, since the marina was used in interstate commerce and had become the legal equivalent of a toll-charging channel or harbor, it was subject to regulation by the Corps of Engineers under the Rivers and Harbors Act, as well as to improvement and regulation for navigation. Thus a public navigation servitude could be imposed upon the privately constructed waterway after paying reasonable compensation. (Reinders-Florida)

COUNTY AND MUNICIPAL POLLUTION CONTROL FACILITIES.
Ark Stat Ann secs 13-1901 thru 13-1903, 13-1912 (Cum Supp 1975).

Descriptors: *Treatment facilities, *Arkansas, *Legislation, *Water policy, *Water pollution treatment, Water quality control, Air pollution, Sewage, Chemical wastes, Domestic wastes, Industrial wastes, Municipal wastes, Water pollution, Pollution abatement, Water quality standards, Environmental sanitation, Environmental engineering.

Arkansas has enacted legislation providing for county and municipal pollution control facilities. Pollution control facilities have been determined to be essential to promote the health, safety and physical welfare of the state and to secure the development of industry. Therefore, any municipality or county is authorized to own, acquire, construct, equip, improve, maintain, sell, lease, contract or otherwise deal in facilities for the disposal or control of sewerage, water pollution or air pollution. To obtain the permanent financing necessary to accomplish pollution control, municipalities and counties are authorized to expend any available revenues and to issue bonds of the amount necessary for payment of any costs, including incidental costs. This act is intended for liberal construction, but nothing in this act is to be construed to authorize any municipality or county to sell bonds or to use the proceeds to condemn or purchase any distribution system controlled by a regulated public utility. (Comer-Florida)

KELLY RANCH V SOUTHEASTE COLORADO WATER CONSERVANCY D TRICT (PLAN OF AUGMENTATION DEVELOPER).
550 P2d 297-308 (Colo 1976). 12 p.

Descriptors: *Colorado, *Water supply develo ment, *Water allocation(Policy), *Water distric *Water supply, Water conservation, Water d tribution(Applied), Water management(Applie Well permits, Well regulations, Water righ Water permits, Water policy, Water resource Water resources development, Water users, C sumptive use, Planning.

Plaintiff residential developer had sought appro of a plan to increase his supply of water development of new or alternate means of wa resources. The plan was rejected by the wa court and the plaintiff appealed. The plan for a mentation called for the developer to remove p manently 14 acres of native pasture and to use t water which had historically been used for irri tion of that acreage to replace water to be c sumptively used in the proposed resident development. The plan also provided for stori

e of the water normally used in the irrigation on for year-round use to prevent injury to s in the area. The defendant water district con- ed that any acceptable plan for augmentation ired the addition of new water into the water em. The Supreme Court of Colorado held that water need not be injected into the water em to validate a plan for augmentation. Since laintiff had met his burden of proving that the unt of return flow from in-house use of the water was as stated and since possible pollu- effects of the plan were not at issue, the court oved the augmentation plan. TE EX REL BROWN V ROCKSIDE RECLA- TION (STATUTE PROVIDING FOR GRANT- OF PERMITS RELATING TO WATER LUTION CONTROL--APPLICATION).
NE2d 448-54 (Ohio 1976). 7 p.

riptors: *Ohio, *Water permits, *Public th, *Water pollution control, *Water quality rol, *Odor, Air pollution, Odor-producing e, Public rights, Water quality standards, l aspects, Judicial review, Administrative cies, Waste treatment, Waste disposal, Solid es, Water injury.
tifiers: *Administrative regulations, uisance(Legal aspects).

tiff attorney general brought this action in ance to enjoin defendant solid waste disposal operator from operating its disposal site. The tiff alleged that the defendant was depriving ens of the beneficial use of state waters and giving off odors in violation of state law. The Supreme Court held that the statute relating ffensive smells as being injurious to public th and comfort was a general nuisance provi- and was not applicable to a duly licensed solid e disposal operation. When the legislature orizes acts to be done which previously would constituted a nuisance, such acts no longer egally a nuisance insofar as the public is con- ed. The court further found that the defendant solid waste disposal operation, did not place waste into any body of water or upon any bank. Finally, the statute providing for permits relating to water pollution regulation did not control because the site was licensed by the director of the Environmental Protection Agency; therefore, its operation would follow prescribed Agency's procedures. COUNTRY KNOLLS WATER WORKS, INC V REID (LIMITATION OF OUTPUT OF PRIVATE WATER SUPPLIER'S WELL).
383 NYS2d 661-65 (App Div 1976). 5 p.

Descriptors: *Well permits, *New York, *Well regulation, *Well data, *Water management(Applied), Wells, Water control, Water storage, Water conveyance, Water permits, Regulation, Water pollution control, Water pressure, Legal aspects, Permits, Administrative agencies, Pipes, Pumping.
Identifiers: *Administrative regulations, Evidence.

Plaintiff private water supplier brought this action to review the determination by defendant commissioner of the Department of Environmental Conservation which modified plaintiff's application to expand his water system, thereby limiting the output of plaintiff's well. The plaintiff sought application for the approval of two new wells, but the application was denied on the grounds that inadequate information was available concerning possible environmental effects of such construction. The plaintiff contended that the challenge was not based on substantial evidence. The court held that a private water supplier could not be required to maintain minimum water pressure throughout the consumer's system. In this case, though, rationality being the test to find substantial evidence, the commissioner was justified in limiting plaintiff's output. The court then went on to state that the storage capacity requirement must be based upon design average consumption and not upon peak demand consumption. (Welch-Florida)

LEASES OF LAKES, PONDS, STREAMS AND RESERVOIRS.
Okla Stat Ann, tit 11, secs 321 thru 322 (1959).

Descriptors: *Fish establishment, *Oklahoma, *Leases, *Lakes, *Recreation, Ponds, Streams, Reservoirs, Local governments, Cities, Legislation, Water supply, Hunting, Fishing, Commercial fishing, Public access, State government, Legal aspects, Water utilization, Fish hatcheries, Fisheries.

Municipalities in the state of Oklahoma which own or control lakes or watercourses for water supply purposes may lease or issue licenses for the use of these bodies of water for hunting, fishing, or the propagation of fish. The maximum period for such a lease will be ten years. If the terms of the lease allow the public free hunting and fishing privileges, however, the maximum period may be for twenty-five years. No lease shall be issued to allow the propagation of fish for commercial purposes. (Capehart-Florida)

MINING AND MANUFACTURING CORPORATIONS.

Descriptors: *Oklahoma, *Mineral industry, *Ditches, *Water utilization, Mining, Flumes, Tunnels, Right-of-way, Diversion, Damages, Mills, Irrigation, Streams, Water conveyance, Priorities, Mineralogy, Excavation, Mining engineering, Diversion structures, Routing, Legislation.

The articles of incorporation of a corporation formed to construct a ditch to carry water to any mines or mills or to lands for irrigation must specify the stream and the place on the stream from which water is to be taken, the line of the ditch, the intended use of the water, and the route and purpose of any flume. Ditch corporations are given the right-of-way over the ditch line and the right to divert stream waters through the ditch so long as there is no interference with pre-existing ditches or water rights. The ditch must be constructed and maintained so that water will not escape and injure any property. Corporations formed to construct mining tunnels must specify the course of the tunnel and the minerals to be excavated. Any corporation which fails to commence construction within 90 days or complete its work within two years shall forfeit all right to the route. (Capehart-Florida)
W77-01118

WATER AND WATER RIGHTS,
Cal Const Art 14 secs 1,3,4.

Descriptors: *Beneficial use, *California, *Water rights, *Riparian rights, *Land tenure, Appropriation, Public use, Constitutional law, Water conservation, Water resources, Conservation, Diversion, Regulation, Federal government, Legal aspects, Legislation, Streams, Governments.

California has enacted legislation providing that the use of appropriated water is a public use subject to conserve and preserve the water resources of the state. Thus, a riparian land owner has the right to reasonable use of stream waters adjacent to his property if he utilizes reasonable diversion methods. However, riparian rights in a stream only attach to so much of the flow of water as is required for a reasonable use of the land. Furthermore any governmental agency which acquires an interest in real property in the state must conform to the state laws regarding the acquisition, control, use, and distribution of water with respect to the land so required. (Capehart-Florida)
W77-01119

NAVIGABLE WATERS (DEFINITION, ENUMERATION AND OFFENSES).
Cal Harbors and Navigation Code Ann secs 90 thru 152 (West 1955), as amended, (Supp 1976).

Descriptors: *California, *Navigable waters, *Penalties(Legal), *Public access, *Legislation, Coasts, Streams, Transportation, Trespass, Rivers, Harbors, Sawdust, Wastes, Oil, Trees, Navigation, Negligence, Legal aspects.
Identifiers: *Navigation obstructions, Oil spill cleanup.

California has enacted legislation providing that streams large enough for the transportation of commercial products are to be deemed public ways for navigational purposes. However, when a

navigable course is in floodstage, the waters flowing outside the established boundaries of the watercourse are not navigable. The navigable waters of the state are enumerated and the extent of navigability of each is described. Unlawful acts with regard to navigable waters include: the obstruction of navigable waters by felling trees; any obstruction of navigable waters; the dumping of ballast into a harbor; the non-emergency or non-accidental discharge by a vessel of fuel oil into navigable waters; and the depositing of sawdust or refuse in Humboldt Bay. A civil penalty is established for the intentional or negligent discharge of oil into any state waters and liability is imposed for clean up costs. (Capehart-Florida)
W77-01120

WATER POLLUTION PROHIBITED.
Cal Fish and Game Code Ann secs 5650 thru 5803 (West 1958), as amended, (Supp 1976).

Descriptors: *California, Water pollution, *Legislation, *Water pollution control, *Public health, Pollution, Oil, Wastes, Sawdust, Industrial wastes, Toxicity, Sewage wastes, Water quality control, Shellfish, Administrative agencies, Law enforcement, Inspection, Mine wastes, Hydraulic mining, Rivers, Permits, Dredging, Abatement.

California has enacted legislation for the purpose of preventing and controlling water pollution. Prohibitions are placed on the deposit or discharge into state waters of certain substances including industrial wastes, factory refuse, petroleum products or residues, and other materials harmful to fish, plant or bird life. The dumping of cans, bottles, garbage, and junked vehicles into state waters is also prohibited. Correction of chronic water pollution conditions is the responsibility of regional water pollution control boards. Permits from the Department of Fish and Game are required for the use of dredge equipment in state waters. The Department of Public Health is responsible for the inspection of shellfish beds. If the beds are contaminated so that public health would be endangered by their use, the department is required to prevent and to post notices prohibiting the taking of shellfish from the area. Also, mining operations in the Trinity and Klamath River Fish District are to be conducted so as to prevent the pollution or contamination of the waters in the district from July through November. (Capehart-Florida)
W77-01121

POLLUTION OF NAVIGABLE WATERS.
Cal Health and Safety Code Ann secs 4400 thru 4468 (West 1970), as amended (Supp 1976).

Descriptors: *California, *Waste disposal, *Navigable waters, *Legislation, *Water supply, Radioactive waste disposal, Boats, Penalties(Legal), Water pollution, Public health, Inspection, Sewage disposal, Law enforcement, Septic tanks, Livestock, Swimming, Waste disposal wells, Aquifers, Reservoirs, Fishing, Permits, Grazing.
Identifiers: Houseboats, Nuisance(Legal aspects), Injunctive relief, Ocean dumping, Ocean disposal.

California has enacted legislation prohibiting the dumping of garbage into navigable waters of the state. It is a misdemeanor to load or to permit garbage to be loaded on a vessel for dumping in navigable waters. Procedures are established for the carrying of a health inspector by vessels engaged in ocean disposal of garbage or radioactive wastes. Furthermore, vessels operating in navigable waters or tied to a dock having toilet facilities shall not discharge any human excreta into navigable waters. Activities which cause or might cause contamination of a stream, pond, lake or reservoir serving as a source of water supply are prohibited. Such activities include bathing, washing clothes, septic tank drainage, or livestock pollution. However, public fishing may be allowed on publicly owned reservoirs used for drinking water purposes if the water quality is not affected and if permitted by the State Department of Health. (Capehart-Florida)
W77-01122

MILLER ANTI-POLLUTION ACT OF 1971 (ABSOLUTE LIABILITY OF PETROLEUM CARRIER).
Cal Harbors and Navigation Code sec 293 (West Supp 1976).

Descriptors: *Boats, *Navigable waters, *California, *Oil spills, *Transportation, *Oil industry, Ships, Damages, Natural resources, Marine biology, Wildlife, Navigable waters, Jurisdiction, Oceans, Governments, Oil pollution, Water pollution, Water pollution sources, Legislation.
Identifiers: *Absolute liability.

California has enacted legislation providing that the owner or operator of any vessel which transports petroleum or fuel oil on a commercial basis shall be absolutely liable without regard to fault for any property damage within the state. Furthermore, such owner or operator shall be liable for any damage or injury to the natural resources of the state which is caused by the discharge or leakage of petroleum or fuel oil from the vessel into the navigable waters of the state. Such liability is imposed when the damage is caused directly or proximately by acts of the owner or operator and not when the cause can be attributed to the actions of another agency which were not foreseen or foreseeable. THE GROUND WATER LEGAL REGIME INSTRUMENT OF POLICY OBJECTIVES A MANAGEMENT REQUIREMENTS,
City Univ. of New York.
R. D. Hayton.
In: Proceedings of the International Confere On Water Law and Administration, Internati Association for Water Law, February 8-14, 1 Caracas, Venezuela; Published by the Comm sion for The National Water Resources Devel ment Plan (Coplanarh), Caracas, Venezuela 272-293, 1976. 22 p.

Descriptors: *Water quality cont *Groundwater availability, *Groundwa *Foreign countries, *Well regulations, Grou water mining, Groundwater potential, Grou water resources, Permits, Regulation, Water lution, Water allocation(Policy), Water ta Water table acquifers, Water users, Water we Legal aspects.

Legal systems around the world have long trea ground water as a system apart, and h developed rules and regulations that do not refl ground water's relationship with the water syst of a nation as a whole. Also, each country's l are different. For example, Islamic law preve wells from being dug too close to one already existence. In Spain, rights to ground water dep on the nature of the overlying land whether i public or private; and many European count follow the rule that ground water belongs absol ly to the owner of the overlying land, accordin the principle that land ownership includes titl everthing in the subsoil. Recent trends in grou water law indicate that restrictions on the limited title are being imposed. For instance, following are becoming prevalent: use limitatio quantity of extraction limitations; drilling perm

rictions and standards; use licenses; zones of servation or prohibition; and reporting and re-ering requirements. The world's nations are coming to the point of view that as surface r availability diminishes through pollution, ter steps must be taken to protect ground r resources. (Frank-Florida)

ent technological advancements may serve to ease water demand. For example, the use of ooling systems that employ closed cycles in- d of consuming large quantities of freshwater help lower demand, as will the industrial use rackish water for cooling purposes. The im- ement of wind-generation techniques and the expansion of cooling ponds, as well as the new drip irrigation, should also help curb the growing need for water. A more efficient use may be made of water. A more efficient use may be made of water through re-use techniques. Industry, which is one of the largest water users, is beginning to find second and even third uses for water within a single plant, even if such re-use require some in-house treatment. Water supply can also be increased by better desalination techniques, cloud seeding and long-distance transportation of water from high to low rainfall areas. Water law itself must better integrate surface water with ground water, as today they are treated as two distinct systems when they are really part of the same cycle. Zoning and soil management must become integrated with water management as well. Finally, the law must assess new technologies and decide which ones will be developed, restricted, blocked or fostered. (Frank-Florida)
W77-01184

LEGAL PROBLEMS ASSOCIATED WITH THE ROLE OF PLANNING IN WATER RESOURCES MANAGEMENT,
Melbourne Univ., Parkville (Australia). College of Law.
S. D. Clark.
In: Proceedings of the International Conference on Water Law and Administration, International Association for Water Law, February 8-14, 1976, Caracas, Venezuela; Published by the Commission for the National Water Resources Development Plan (Coplanarh), Caracas, Venezuela, p 460-488, 1976. 29 p, 12 ref, 1 append.

Descriptors: *Comprehensive planning, *Long-term planning, *Legal aspects, *Decision-making, *Water resources, Short-term planning, Project planning, Project benefits, Political aspects, Political constraints, Management, Administration, Programs, Projections.

Defined planning criteria and procedures are not always observed in public and private water development proposals. This failure to include desired or necessary input greatly reduces the effectiveness of the proposals. It is, therefore, the province of the law to make sure that these criteria and procedures are observed. Since legal techniques and institutions cannot guarantee wise decisions, the law must ensure that decision makers are adequately informed and give proper consideration to relevant criteria. The author contends that the ultimate decision on a proposal is properly political; he does not wish to push the law into that decision-making process. Nevertheless, the law should force the examination of all possible results. In discussing the political process, the roles of the leislature, executive and the courts are examined in connection with their difficulties in imposing planning procedures. Practical problems of drafting legislation to define planning procedures are also considered. (Frank-Florida)
W77-01185

FLORIDA'S SYSTEM FOR REGULATION OF WATER USE--A MODERN INSTRUMENT FOR SOUND WATER RESOURCE MANAGEMENT,
Florida Univ., Gainesville. Coll. of Law.
F. E. Maloney.
In: Proceedings of the International Conference on Water Law and Administration, International Association For Water Law, Feb 8-14, 1976, Caracas, Venezuela. 21 p, 2 append.

Descriptors: *Florida, *Legislation, *Administrative agencies, *Water resources development, *Water permits, *Planning, *Water utilization, Administration, Legal aspects, Water use, Groundwater utilization, Prior appropriation, Riparian rights, State governments, Water resources.
Identifiers: *Florida Water Resources Act of 1972.

Two different systems for regulating water use have developed in the United States: the riparian system in the East, and the prior appropriation system in the West. Both provide for water rights in perpetuity, as long as the use is proper. Florida has developed a more flexible system under the 1972 Florida Water Resources Act. The system is marked by its reliance on fixed term permits rather than in perpetuity permits. This gives the state the ability to re-evaluate water right priorities as time goes on, instead of being locked into an existing allocation system. The Florida law provides for a two-tiered administrative structure with overall state-level supervision plus regulatory implementation by five water management districts whose boundaries are based on hydrological considerations. Also examined are the standards and considerations that go into the issuance of consumptive use permits, as well as provisions for water shortages and emergencies. The law is noteworthy for its assumption that the public should be the primary beneficiary of water benefits and not merely private persons. Most fixed term permits will undoubtedly be renewed, but the state does have the flexibility to deal with changing water resource conditions. (Frank-Florida)

SEA FARMING: A MEANS FOR CONTRIBUTING TO FEEDING MANKIND, (IN SPANISH),
Instituto de Biologia Marina, Mar del Plata (Argentina).
E. E. Boschi.
Inst Biol Mar (Mar Del Plata) Ser Contrib. 281, p 1-31, 1974.

Descriptors: Marine organisms, *Fish farming, Foods, Tilapia.
Identifiers: France, Japan, *Sea farming, Spain.

The cultivation of marine organisms for human food will never take the place of commercial fishing since only 3% of the world's ocean surface can be used for this activity. A coastal fringe of not more than 30 m depth offers the best immediate possibilities. The Food and Agriculture Organization (FAO) has estimated that 43 countries in 1972 produced, by ocean and lake farming, 3,700,000 tons of fish and 1,300,000 tons of shellfish, 7.5% of the total production for that year, or 65,000,000 tons. In countries with the greatest resources, artificial production of marine and freshwater animals has developed very slowly. Two principal orientations are meeting basic food demands by producing cheap and easy-to-grow food fishes, such as Tilapia, carp, etc., and growing species of high market value, especially shellfish, such as oysters, scallops, shrimp and lobster. The Spanish mussel industry raises 50% of the world's supply of that shellfish in pools along rivers. Similar examples are cited for France and Japan.–Copyright 1975, Biological Abstracts, Inc.

DEALING WITH VARIABLE FLOOD HAZARD,
Corps of Engineers, Fort Worth, Tex.
J. A. McCrory, L. D. James, and D. E. Jones, Jr.
Journal of the Water Resources Planning and Management Division, Vol. 102, No. WR2, p 193-208, November 1976. 7 fig, 4 tab, 17 ref. Amer. Soc. of Civil Engrs. Proc.

Descriptors: *Flood control, *Flood damage, *Flood plain insurance, *Flood plains, *Regulation, Water resources, Flood frequency, Non-structural alternatives, Management, Hazards.
Identifiers: *Flood hazards.

The National Flood Insurance Program administered by the Federal Insurance Administration, HUD-FHA Minimum Property Standards, and most local flood-plain management programs define flood hazard areas as lands inundated by the 100-year flood. Curves are developed that can be used to manage flood-plain land on an equal damage exposure basis given the stage-frequency relationship for the flood plain and the stage-damage relationship for each property. The issue of acceptable damage exposure is considered through comparisons with fire insurance rates, property taxes, and rates of return on property investments. An examination of the difference between the two indices shows that the equity advantage of management on the basis of damage exposure can be balanced with the administrative advantage of regulation on a frequency basis by continuing to use frequency but varying the return period used according to the damage exposure. EVALUATION REPORT: WATER RESOURCES APPRAISAL FOR HYDROELECTRIC LICENSING. DAYTON DEVELOPMENT, PROJECT NO. 287, FOX RIVER, WISCONSIN AND ILLINOIS.
Federal Power Commission, Washington, D.C. Bureau of Power.
May 1976, 42 p, 15 fig, 6 tab.

Descriptors: *Hydroelectric power, *Hydroelectric plants, *Permits, *Illinois, Federal Power Act, Dam failure, *Water resources development, Ice jams.
Identifiers: Licenses, *Fox River(IL), North Counties Hydro-electric Company, Illinois River Basin.

The Dayton hydroelectric project is located on the Fox River, Illinois, 70 mi southwest of Chicago. This report included descriptions of the Fox River Basin, prior reports and current investigations, the economy of the Basin, existing and related water resources developments, a history of the Dayton project (dating to 1920), and future development and utilization. The original license for the project was granted in 1924, to extend for 50 years. Currently North Counties Hydro-Electric Company is the sole licensee (now on annual license). The Illinois Power Company purchases the entire output of the plant. Three times the project operation has been shut down by ice jams in the tailwater area which resulted in claims against the United States for damages allegedly caused by the Corps of Engineers' Starved Rock Dam on the Illinois River. There have been only minor repairs made over the years and recent surveys have indicated that the project is in poor condition and is potentially dangerous. A major buttress footing has been u dercut along with other buttresses and wingwal However, in the event of sudden dam failure, lit damage is anticipated because of the undevelop nature of areas below the dam and small volume water behind the dam. Redevelopment of the s is considered unwarranted and repairs on t structure are estimated at $160,000. Thus futu operation of the Dayton project appears to financially questionable. This report does come to conclusions about the disposition of t Dayton project, but provides information for t Federal Power Commission and its staff to co sider that disposition. Identifiers: *Mid-Arkansas River Basin(Ok *Ecological standards.

This study attempts to develop ecological st dards to assist in the evaluation of water resour development. The standards developed meaningful for and applicable to all the aqua land and land-water interface environments. T steps were undertaken to establish ecological st dards. The first one is the categorization development levels of natural environment measuring specific socio-economic factors wh are capable of delineating the human modificat of the ecological system. The second one is development of the ecological standards response to various development levels so as reflect the human influence on the ecolog system. A unique and significant feature of project is the combination of both socio-econo and environmental considerations in the eval tion of the ecological system. The validation of methodology is accomplished by using data fr the Mid-Arkansas River Basin.

aintiff city sought modification of a permanent
unction which had been obtained by the defen-
nt on behalf of himself and others who cul-
ated land in a critical water area. The injunction
ohibited the city from pumping water out of the
tical water area for transport and use in the city.
review the enjoining court held that if the city
rchased land within the critical water area it
uld use the water formerly used for growi ng
ops thereon. This the city had done; now it
ught to modify the injunction to allow pumping
begin. The defendant contended that the injunc-
n did not allow the city to pump out the greatest
nount of water used in any year on the parcel
rchased, but only to pump out an average of the
nual maximum amount of water used on the par-
l retired from utilization. The Arizona Supreme
urt accepted defendant's argument and in-
preted the injunction's use of the word
storical' as requiring the word 'maximum' to be
stricted to an average of the annual maximum
nount of water previously used on the parcel
rchased. (Welch-Florida)

e use of models for guiding environmental pol-
should be distinguished from their use in imple-
enting management policies already decided
on. Ecosystem models are of potentially great
lue for guiding and informing incremental deci-
ons regarding environmental policy. They are un-
ely to be used as a basis for comprehensive
structuring of programs. Their greatest use may
in identifying points of leverage, where incre-
ental policy changes will have the greatest long-
m beneficial impact. For this reason, provision
r formal sensitivity analysis is essential in
odels used to guide environmental policy.
ological models are more likely to influence pol-
decisions if they incorporate features which
ould be a part of any good model but which are
ten skimped-upon: adequate documentation;
asonableness of prediction; explanation of limits
d probable range of error; flexibility to deal with
anticipated problems; and effective presenta-
n and display. (Bell-Cornell)

DRAFT ENVIRONMENTAL STATEMENT: PROJECT SKYWATER A PROGRAM OF RESEARCH IN PRECIPITATION MANAGEMENT, VOLUME I OF II.
Bureau of Reclamation, Washington, D.C.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 113, Price codes: A14 in paper copy, A01 in microfiche. 1976. 220 p, 36 fig, 37 tab.

Descriptors: *Environmental effects, *Cloud seeding, *Weather modification, *Water resources development, Artificial precipitation, Weather, Water management(Applied), Water resources, Technology, Research and development, Rocky Mountain region, Pacific Coast region, Agriculture, Silver iodide, On-site investigations, Erosion, Avalanches, Snowpacks, Federal government, Snow, Water yield improvement.
Identifiers: *EIS, *Project Skywater.

The Department of the Interior has filed a draft environmental statement on its research effort in developing the technology of cloud seeding. The Department hopes that cloud seeding will be come a useful water resources management tool. Most of the studies have been conducted in the Western states, an area which includes a subtropical climate along the Pacific Coast, a vast, arid region in New Mexico and Arizona and the high, weather-making Rocky Mountains. The environmental impact of the project is expected to be minimal with only insignificant increases in plant growth and streamflow. With development of a successful technology, significant increases in plant growth and streamflow would be expected. Other than a probable increase in the incidence of avalanches, no significant adverse impacts have been identified. Project alternatives include such methods of increasing water resources as desalinization, exploitation of groundwater resources, recycling of water, and land management for increased water yield. Resources consumed by the project include cloud seeding chemicals, airplane fuel, and electrical energy. (Capehart-Florida)

ARE HOVERCRAFT A MAJOR CAUSE OF DISTURBANCES TO INERTIDAL INVERTEBRATES,
Institute of Terrestrial Ecology, Norwich (England). Colney Research Station.
S. A. McGorty, Jenyon, and R. Le B. Williams.
Biological Conservation, Vol. 9, No. 7, p. 13-20, 1976, 3 fig., 3 tab., 3 ref.

Descriptors: *Environmental effects, *Invertebrates, *Habitats, *Intertidal areas, *Sands, *Particle size, *Food chains, Populations, Analytical techniques, On-Site Data Collections.
Identifiers: *Hovercraft, Nereis spp., Arenicola spp., Spionid spp.

The densities of intertidal invertebrates in areas within and outside a hovercraft flightpath were compared by analysis of variance and least significant range tests. No evidence was found to suggest that the hovercraft had significantly reduced the density of invertebrates in the flightpath area. Only five species groups (Nereis diversicolor, Spionid spp., Bathyporeia spp., Macoma balthica, and Arenicola marina) had significantly different densities between areas, and in each case there was a density gradient alongshore. In three species groups (Spionid spp., Bathyporeia, spp., and Macoma balthica) density was related to the percentage of fine sand at each site. (Katz)

ENVIRONMENTAL DATA MANAGEMENT,
G. K. Young, and G. F. Tierney.
Journal of the Water Resources Planning and Management Division, Vol. 102, No. WR2, Proceedings of the American Society of Civil Engineers, p 255-264, November 1976. 5 fig.

Descriptors: *Computer models, *Data processing, *Statistical methods, Water quality, Environmental engineering, Standards, Forecasting, Systems analysis, Simulation analysis.
Identifiers: *Environmental quality, *Information systems, *Data management, Error, Cost distribution, Protocol, Data.

A holistic viewpoint is taken of basic data needs to support environmental forecasting, modeling, and decision making. A protocol is suggested which places forecast errors in a key role. Data bases should be reviewed and their error properties analyzed with respect to forecasting precision. Data programs should be oriented to minimizing forecast variance within cost and overall program needs constraints. Recognized big issues concern the: (1) Need for a rational data assessment protocal; (2) difficulty of generalizing requirements; (3) fact that simulation models have outdistanced the availability of data to support them; (4) observation that agency programs apparently place too much stress on analysis and not enough on data gathering activities; and (5) chronic problem that water quatity and quality data collection needs to be coordinated. ARTIFICIAL ISLANDS: INFORMATION NEEDS AND IMPACT CRITERIA,
Delaware Univ., Lewes. Marine Studies Center.
L. Watling.
Marine Pollution Bulletin, Vol. 6, No. 9, p. 139-141, September, 1975. 3 ref.

Descriptors: *Environmental effects, *Reviews, Water quality, Structures, *Salinity, *Temperature, *Turbidity, Technology, *Light penetration, *Water pollution effects, Water quality control, Marine animals, Benthos, Sediments.
Identifiers: *Artificial Islands, *Environmental impact.

This is a review of the information needed before realistic forecasts can be made of the effects of new developments on the marine environment. The review resulted from the need to assess the impact of an artifical island off the east coast of the United States. Manmade structures in the sea, ranging from oil platforms to large anchored floating structures and reclaimed land in shallower water, are proliferating around the world with more forseen in the future. It will be important to forecast the effect they have on the surrounding sea areas and marine resources as accurately as possible. (Katz)

METHOD FOR FINDING TEMPERATURE ENVIRONMENTS FOR FISH,
G. Peterson.
U. S. Patent No. 3,968,586, 10 p, 8 fig, 1 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 948, No 2, p 440, July 13, 1976.

Descriptors: *Patents, *Water measurement, *Temperature, *Thermocline, *Environmental gradient, Depth, Fish, Fish populations, Fishing, Environments, Habitats, Instrumentation.

This invention relates to a method of prospecting for fish in lakes and oceans, and more particularly to water differential temperature measurement for use in conjunction with boats for the express purpose of locating suitable or likely environments for specific varieties of fish. Since fish have preferred temperatures, they will seek these temperatures in lakes and oceans if they can be found and will usually stay in those regions where the preferred temperatures prevail. Fishing boats are equipped with an apparatus whereby temperature measurements can be taken at, or near the surface of a large body of water. The apparatus is comprised of a highly sensitive differential temperature measuring means such as a pair of thermistor-type probes which are connected to opposite arms of a highly sensitive wheatstone bridge curcuit. On the the thermistors is easily interchangeable with a variable standard resistor thereby providing the capability of taking direct temperature measurements. The method consists of locating the specific varieties of fish by making a series of passes with the boat, making differential temperature measurements just beneath the surface of the water, plotting differential temperature measurements on the chart and comparing the chart with known temperature environments suitable for certain types of fish. S. J. Niskin.
U.S. Patent No. 3,971,251, 9 p, 9 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 948, No 4, p 1353, July 27, 1976.

Descriptors: *Patents, *Instrumentation, *Water measurement, *Currents(Water), *Flow measurement, Current meters, Waves(Water).
Identifiers: Instrument housing.

When measuring the flow of water for direction and velocity instruments must be maintained in a horizontal position and facing the direction of flow of water. However, in the event the current is very fast or the water becomes rough with high and violent wave actions, the float and cable to which the instruments are attached will cause the latter to rise and fall and oscillate or vibrate out of their proper position so that inaccurate results are obtained. This invention provides water borne instruments with a housing that is dynamically balanced whereby the instruments are maintained in the current of the body of water in a predetermined and optimum position for the operation of the instruments. The housing is supported by a cable anchored at one end and having a float at the other end, the housing being pivotally suspended from a stand-off which is rotatably secured to the cable to prevent entanglement of the housing with the cable. The housing is supported at its mid-portion with arms extending horizontally. The meters are mounted on each of the arm portions facing in the direction from which the water flows. The housing maintains this position with rudders or vanes which have a dampening effect on forces attempting to swing the housing out of alignment with the current flow. (Sinha-OEIS)

PROSPECTS OF HYDROMETRY IN THE LIGHT OF MODERN TECHNOLOGY,
International Commission on Irrigation and Drainage, New Delhi (India).
K. K. Framji.
International Commission on Irrigation and Drainage Bulletin, p 20-28, January 1975. 44 ref.

Descriptors: *Hydrometry, *Measurement, Technology, Water quality, Water quality control, Water measurement, Irrigation, Instrumentation.

The prospects from the use of modern technology that is, the application of modern sciences and the use of modern tools and materials are clearly bright for the development of precise methods and instruments of hydrometry. Sciences and technologies, such as computer-science electronics, ultrasonic and telemetry, the use of light weight plastics and special non-ferrous alloys, the application of specially-designed hydrometric ships and aluminium and fiberglass boats, all point to future prospects of achieving high degrees of precision and uniformity in measurements. Also in the not too distant future the use of space craft and earth satellites for automatic transmission of automatically observed data is no longer in the realm of fantasy. The sky is the limit. DESIGN AND PRELIMINARY EVALUATION OF AN IMPROVED ARTIFICIAL SUBSTRATE SAMPLER FOR AQUATIC MACROINVERTEBRATES,
Texas Instruments, Inc., Northfield, Mass. Ecology Service Group.
M. D. McDaniel.
Prog Fish-Cult. 36(1), p 23-25, 1974.

Descriptors: *Invertebrates, Sampling, Benthos, *Analytical techniques, Monitoring, Design.

A number of artificial substrate devices have been developed to circumvent obstacles encountered in conventional benthic sampling for macroinvertebrates. These devices, at best, are only semi quantitative, yet they provide freedom in selection of sampling site and homogeneity of substrate type and area. Their use can result in samples with good potential for comparisons within and among various aquatic ecosystems. An improved artificial substrate sampler has been developed that combines the features of a multiple-plate sampler with a synthetic webbing material. The new sampler is inexpensive, easily portable; and may be processed in the field and returned to the water or returned to the lab for processing. It is an effective sampling method in both lotic and lentic environments and that is possesses great potential for biological water quality monitoring.—Copyright 1975, Biological Abstracts, Inc.

hen water level data are stored on a computer, amount of storage space needed can be duced by eliminating data that can be provided proximately by linear interpolation. Benefits m reduced computer time are also obtained ce fewer values have to be retrieved from the . The aim of the compression process is to filter small and abrupt water level fluctuations hout affecting the information content of the ord. To avoid over-compressing the data, it is irable to have some method by which an upper it on the 'compression range' can be deter- ned. A method was presented by which this it can be obtained under different assumptions out the accuracy of a rating curve. (Sims-ISWS) 7-01132

Identifiers: *Teton Dam(Idaho), *Snake River, Inundated area.

The failure of the Teton Dam caused extreme flooding along the Teton River, Henrys Fork, and Snake River in southeastern Idaho on June 5-8, 1976. No flooding occurred downstream from American Falls Reservoir. The inundated areas and maximum water-surface elevations are shown in a series of 17 hydrologic atlases. The aea covered by the atlases extends from Teton Dam downstream to American Falls Reservoir, a distance of 100 miles. The extent of flooding shown on the maps was obtained by field inspections and aerial photographs made during and immediately after the flood. There may be small isolated areas within the boundaries shown that were not flooded, but the identification of these sites was beyond the scope of the study. The elevation data shown are mean-sea-level elevations of high-water marks identified in the field. This particular map (in the 17-map series) shows conditions in the Moreland quadrangle. W77-01411

SURFACE WATER SUPPLY OF THE UNITED STATES, 1966-70: PART 3. OHIO RIVER BASIN--VOLUME 1. OHIO RIVER BASIN ABOVE KANAWHA RIVER.
Geological Survey, Reston, Va.
Available from Supt. of Documents, GPO, Wash., D.C. 20402, price $5.45. Water-Supply Paper 2107, 1976. 668 p, 1 fig.

Descriptors: *Hydrologic data, *Surface water, *Streamflow, *Lakes, *Ohio River, River basins, Maryland, New York, Ohio, Pennsylvania, West Virginia, Basic data collections, Runoff, Discharge(Water), Gaging stations, Flow measurement, Average flow, Reservoir stages.
Identifiers: *Ohio River basin, Maximum discharges, Minimum discharges.

This is one of 37 reports presenting records of stage and discharge of streams, and of stage and contents of lakes and reservoirs in the United States during the 1966-70 water years; it contains the records for gaging stations and partial-record stations in the Ohio River basin above Kanawha River. This report is one of the second series of water-supply papers to be published on a 5-year basis. The first series covered the 5-year period October 1, 1960, to September 30, 1965. This series covers the period October 1, 1965, to September 30, 1970. The daily table for stream-gaging stations gives the mean discharge for each day and is followed by monthly and yearly summaries of total, average, maximum, and minimum discharges. (Woodard-USGS)
W77-01412

SURFACE WATER SUPPLY OF THE UNITED STATES, 1966-70: PART II. PACIFIC SLOPE BASINS IN CALIFORNIA--VOLUME 4. NORTHERN CENTRAL VALLEY BASINS.
Geological Survey, Reston, Va.
Available from Branch of Distribution, USGS, 1200 S. Eads St., Arlington, Va 22202, price $5.85. Geological Survey Water-Supply Paper 2131, 1976. 747 p, 9 fig.

Descriptors: *Hydrologic data, *Surface waters, *Streamflow, *Lakes, *California, Basic data col-

lections, Runoff, Discharge(Water), Gaging stations, Flow measurement, Flow rates, Average flow, Reservoir, Reservoir stages.
Identifiers: *Pacific slope basins(Calif), Northern Central Valley, Maximum discharges, Minimum discharges, Reservoir content.

This is one of 37 reports presenting records of stage and discharge of streams, and of stage and contents of lakes and reservoirs in the United States during the 1966-70 water years; it contains the records for gaging stations and partial-record stations in the Pacific slope basins in California, Northern Central Valley. The daily table for stream-gaging stations gives the mean discharge for each day and is followed by monthly and yearly summaries of total, average, maximum, and minimum discharges. Data for partial record station are presented in two tables. The first is a table of discharge measurements at low-flow partial-record stations, and the second is a table of annual maximum stage and discharge at crest-stage stations. For most gaging stations on lakes and reservoirs the data comprise a descsription of the station and a monthly summary table of stage and contents. For some reservoirs a table showing daily contents or stage is given. (Woodard-USGS)

HYDROLOGIC DATA FOR URBAN STUDIES IN THE HOUSTON, TEXAS METROPOLITAN AREA, 1974,
Geological Survey, Austin, Tex.
C. E. Ranzau, Jr.
Open-file report, June 1976. 228 p, 16 fig, 14 tab, 4 ref.

Descriptors: *Hydrologic data, *Urban hydrology, *Water quality, *Streamflow, *Reservoir storage, Texas, Rainfall-runoff relationships, Urban runoff, Gaging stations, Flow rates, Chemical analysis.
Identifiers: *Houston(Tex).

Basic hydrologic data collected in the Houston urban area for the 1974 water year (October 1973 to September 1974) are presented. Precipitation data are based on 29 recording rain gages in the Houston metropolitan area. Rainfall for the year was unevenly distributed over the area. Individual station totals ranged from 32.8 inches at the Old Richmond Road rain gage to 61.8 inches at the Llano Street rain gage. The 30-year average (1941-70 is 48.19 inches at the Houston Intercontinental Airport rain gage. The only area-wide storm selected for analysis was the storm of January 19. runoff data are based on discharge measurements and stage records at 19 continuous-record stream-gaging stations, 6 partial-record stream-gaging stations, and 2 reservoir-content stations. A tabulation of water-quality data is included for 19 sites. (Woodard-USGS)

SUGARLOAF CREEK PROJECT (AUSTRALIA): FLOOD STUDIES.
Melbourne and Metropolitan Board of Works (Australia). Water Supply Div.
Report No. MMBW-W-0053, December 1975. 7 p., 12 fig., 3 tables, 3 ref., 2 append.

Descriptors: *Design data, *Reservoir design, *Australia, Unit hydrographs, Inflow, Probable maximum precipitation, Rainfall-runoff relationships, Frequency curves, Duration curves, Rainfall intensity, Small watersheds, *Water supply.
Identifiers: *Sugarloaf Creek Reservoir(Vic), *Yarra River(Vic), *Melbourne(Vic).

The Sugarloaf Creek Reservoir is planned to provide additional storage for metropolitan water supply to Melbourne (Victoria, Australia) by pumping water from the Yarra River during periods of excess flow. The Clark-Johnstone synthetic unitgraph procedure is used to derive the inflow hydrograph resulting from an estimated maximum probable precipitation over the reservoir catchment, and intensity-frequency-duration curves for return periods ranging from one to a thousand years are presented. THOR ACROSS THE LIMPOPO.
Construction in Southern Africa, Vol 20 (6), p 63-39, (1975). 3 fig, 3 tab.

Descriptors: *Water demand, Dam design, Geologic investigations, Barrages, Irrigation, *Water supply, Africa.
Identifiers: *Limpopo River, South Africa, Rhodesia, Thor Dam.

The critical situation with water supplies around Beit Bridge (which is the border post between Rhodesia and the Republic of South Africa) has last, after many years of discussion, led to a pr ject to dam the Limpopo River. Rhodesia w going to participate, but has now dropped out. T project will, however, carry on and the Thor Da will now become a reality. The author gives deta of the water requirements that led to the decisi to construct the dam, as well as full particulars the expected growth rate, demand on the propos dam, the geology of the site, and the specificatio of the dam. SANITARY ENGINEER'S VIEWPOINT ON HE DESIGN, INSTALLATION, MAIN-ENANCE AND COST OF SANITARY RAINAGE SYSTEMS IN HIGH-RISE UILDINGS,
. T. Murray.
lunicipal Engineer, Vol 5 (6), p 51-59, (1974).

escriptors: *Buildings, *Drainage systems, ewerage, *Design criteria, Plumbing, Legisla-on, Costs, Maintenance.
lentifiers: South Africa.

he importance of design and its effect on the in-allation, maintenance and cost of above-ground nitary drainage in high-rise buildings is nphasied. Comments are confined to modern mplex buildings of more than 20 floors. It is in-nded to provide some useful pointers for cost-nscious developers and those responsible for umbing design. This paper deals with the present eed for the future situation and highlights the esperate need for the updating of plumbing by-ws, the establishment of a standard plumbing ode for the country, more intensive specialized ducation for architectural students, and better chnical training for apprentice plumbers. The ntent is based on the experience of a plumbing ntractor. (South Africa)

Report No. ARS-5-126, 13 p, July 1976. 19 fig, 3 tab.

Descriptors: *Chutes, *Settling basins, *Hydraulic structures, *Laboratory tests, *Hydraulic jump, *Oklahoma, Scour, Lakes, Flood control, Model studies, Hydraulics.
Identifiers: *Drop box inlets, *Stillwater(Okla), *Boomer Lake(Okla).

A dam was constructed in 1926 to create Boomer Lake at Stillwater, Oklahoma. Presently the lake serves as a cooling pond and a recreational facility. A chute spillway is proposed so that the lake may also serve as a flood control facility for the city. The site conditions and constraints indicated the need for a spillway with a long weir and a chute. The stilling basin was designed for a flow of 16,000 cfs. A model was built to a scale of 1 to 50. Three different drop (entrance box) inlets were tested and compared to determine their influence on the performance of the chute spillway and the stilling basin at the outlet of the chute. The three inlets were steep entrance box, level entrance box, and deep entrance box. Test results indicated that upstream pool levels, wave heights along the chute walls, and scour depths in the downstream channel were alike for the three entrance boxes. An advantage of the steep entrance box was a smaller associated uplift force. (Singh-ISWS)
W77-01151

METHOD FOR LOWERING GROUND WATER,
A. J. D'Amiano.
U.S. Patent No. 3,965,685, 8 p, 14 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 1946, June 29, 1976.

Descriptors: *Patents, Groundwater, *Water table, *Water levels, *Wellpoints, *Water wells, Water sources, Dug wells, Aquifers.

In order to eliminate the need to waste expensive sand, to avoid the needless labor associated with packing the sand around the well point tube and the need for a high pressure source of water at the side, a modular well point has been developed comprising an inner well point tube, having perforations at the bottom end and surrounded by a coaxial screen. Between the screen and the inner tube, there is placed particulate matter, such as gravel, and the bottom end is sealed. An annular top plate is used to seal the space around the top end of the inner tube and the screen and to seal in the gravel. The upper end of the inner tube is adapted to be coupled to a vacuum pump which pumps the water in the water table surrounding the well point down through the screen, and through the gravel, into the perforations at the bottom of the inner tube, and thence upward out the center of the tube. The prepacked well point, after installation can be removed and reused, avoiding the need for new gravel. The pre-packed modular well point can be made in predetermined lengths and connected together, modularly, to form a well point of any desired length. (Sinha-OEIS)
W77-01196

GEOTHERMAL ENERGY WELL CASING SEAL,
Sperry Rand Corp., New York, (Assignee).
H. B. Matthews.
U.S. Patent No. 3,967,448, 7 p, 2 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 948, No 1, p 53-54, July 6, 1976.

Descriptors: *Patents, *Geothermal studies, *Heat flow, *Temperature, *Thermal conductivity, *Thermal properties, Energy, Energy transfer, Pumps, Steam turbines, Well casings.
Identifiers: Closed-loop steam generator, *Well casing seals.

A geothermal energy transfer and utilization system makes use of thermal energy stored in hot solute-bearing well water to generate super-heated steam from an injected flow of clean water. The super-heated steam is then used for operating a turbine-driven pump at the well bottom for pumping the hot solute-bearing water at high pressure and in liquid state to the earth's surface, where it is used by transfer of its heat to a closed-loop steam generator-turbine-alternator combination for the beneficial generation of electrical or other power. Residual concentrated solute-bearing water is pumped back into the earth. The clean cooled water regenerated at the surface-located system is returned to the deep well pumping system also for lubrication of a fluid bearing arrangement supporting the turbine-driven pump system. The deep well pump system is supported within the well casing pipe from the earth's surface by the turbine exhaust steam conduit. In view of differential expansion effects on the relative lengths of the casing pipe and the exhaust steam conduit, a flexible seal is provided between the suspended turbine-pump system and the well pipe casing. (Sinha-OEIS)
W77-01205

BREAKWATER CONSTRUCTION,
Raymond International, Inc., Houston, Tex. (Assignee).
T. Plodowski.
U.S. Patent No. 3,969,900, 6 p, 5 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 948, No 3, p 885-886, July 20, 1976.

Descriptors: *Patents, *Breakwaters, *Engineering structures, *Buoyancy, Floating, Ocean waves, Barriers, Shore protection, Coastal structures, Piles(Foundations), Structural members.

Arrangements are provided whereby the sea itself is used, through buoyant action to sustain the major portion of the weight of the breakwater. These arrangements include a main module of substantially neutral buoyancy and having an upstanding wall-like surface for resisting wave action. The module is positioned so that its wall-like surface extends from below the sea surface to above the sea surface to encounter sea waves. The module is formed with front and rear portions displaced from each other in a direction transverse to the plane of the wall-like surface. A number of pile members extend down from the front and rear portions of the module and into the sea bed below to a depth sufficient to attain resistance to lateral movement of the main module. The buoyancy distribution of the module is arranged so that the front portion, that is, the portion upstream of wave action, is of negative (sinking) buoyancy

while rear portion is of positive buoyancy. This imposes a tilting force on the module in a direction counter to the forces produced by wave action. In addition the forwardmost pile-like members are prestressed in compression while the rearward pile members are prestressed in tension. As a result, the wave action of the sea in pressing against the wall-like surface acts in an untilting manner so that the stresses in the piles become relieved and the structure is enabled to withstand high sea forces. (Sinha-OEIS)
W77-01221

FLOATING BREAKWATERS,
Ishikawajima-Harima Heavy Industries Co., Tokyo (Japan). (Assignee).
T. Matsudaira, and Y. Mishina.
U.S. Patent No. 3,969,901, 5 p, 7 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 948, No 3, p 886, July 20, 1976.

Descriptors: *Patents, *Breakwaters, *Engineering structures, *Barriers, *Coastal structures, *Shore protection, Ocean waves, Floating.

The primary object of the invention is to provide an improved floating breakwater which may be held substantially at rest against the waves of expected periods without causing pitching, and which may very effectively reflect and depress or abate the waves of a wide range of wave lengths so that a safe and comparatively calm sea space may be provided behind the breakwater. A number of floating breakwater units are interconnected with each other in side by side relation and anchored to the sea bottom with anchor cables or chains. Each floating breakwater unit comprises a center float, a front and rear barrier joined with connecting members in suitably spaced apart relation or directly joined to the center float so as to define the separated spaces between them. The adjacent floating breakwater units are interconnected with suitable interconnecting means in such a way that they may be moved independently from each other to some extent and may be prevented from colliding against and parting from each other. In like manner, the adjacent buoys are interconnected with a suitable connecting member such as rope, chain or bar so that they may be normally spaced apart from each other by a desired distance. (Sinha-OEIS)
W77-01222

BREAKWATER SYSTEM FOR CREATING ARTIFICIAL SANDBARS,
C. W. Greenleaf.
U.S. Patent No. 3,971,221, 6 p, 6 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 948, No 4, p 1343, July 27, 1976.

Descriptors: *Patents, *Breakwaters, *Barriers, *Waves(Water), Shore protection, Sand bars, Coasts, Suspended solids, Floating, Coastal structures.
Identifiers: Artificial sand bars.

The breakwater comprises a flotation member having a leeward end defining a pivotal axis and a structural member for applying a force to the flotation member causing it to pivot about the axis and urge the leeward end into the body of water. The first or leeward end of the flotation member dips below the surface of the water when waves of moderate strength appear. This tends to slow the flow of water, causing suspended sand to drift to the bottom, forming the beginnings of an artificial sandbar. If the waves become too great, the upwardly urged second or windward end will catch the wave crest, and as the wave passes, urge the leeward end to the surface. The leeward end thus provides minimal resistance to the larger waves, and as a result, the flotation member can 'ride out' the destructive force of such waves. When waves of moderate strength reappear, the leeward end of the flotation member will again impede the water flow, causing more sand to gravitate to the seabed. Ultimately, enough sand will drop to the bottom to form an artificial sandbar. The resulting sandbar will typically have all of the shore protection features of the massive, bulk-fill breakwaters. The sandbar, however, is produced at minimal cost and without the obvious transportation and construction problems. After the artificial sandbar has been constructed, the breakwater can be moved to other locations for creating additional sandbars.

VORTEX VELOCITY PREDICTION WITH EMPHASIS DIRECTED TOWARD VORTEX TUBE SEDIMENT TRAP DESIGN,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
R. J. Edling, B. J. Barfield, and C. T. Haan.
Presented at the 1975 Winter Meeting of the American Society of Agricultural Engineers, December 15-18, 1975. Chicago, Illinois. 25 p, 5 fig, 2 tab, 14 ref.

Descriptors: *Sediments, *Sediment control, *Mathematical models, Model studies, Velocity, Design criteria, Forecasting.
Identifiers: *Vortex velocity(Sediments).

The variation in coefficients relating mean velocity, wall velocity and vortex perimeter velocity indicate the values from the empirical technique, if used, could only be considered as rough estimates. The agreement between the expected pattern of stream function and the predicted pattern and the approximation of upper slot and mainstream measured velocities by the mathematical model encourage further work with the model. Closer agreement between measured and predicted values is desirable, however, the present model gives a first order approximation. It is recommended that changes in the lower boundary conditions for turbulence kinetic energy, dissipation and vorticity be studied. Successful prediction of the point mean velocity and turbulent parameters in complex flows would have many applications. (Skogerboe-Colo St)

WAVE ENERGY MACHINE,
E. J. Paradiso.
U. S. Patent No. 3,965,679, 5 p, 4 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 947, No 5, p 1944, June 29, 1976.

Descriptors: *Patents, *Energy, *Energy conversion, *Energy dissapation, *Waves(Water), Energy transfer, Coastal structures, Equipment.

A device for utilizing wave energy that is otherwise lost, or spent in eroding shore lines and/or shore facilities has a combined trough-turbine arrangement. An inclined ramp, curved and triangular deflectors, bucket-wheel combinations, and turbine guards combine with a flywheel to provide smooth-flowing power from wave energy. The interrelationships of the various parts reduces turbulence and increases the thrust of an incomi volume of wave energy to rotate a shaft fro which power can be derived. (Sinha-OEIS)

OCEAN THERMAL GRADIENT POWE PLANT,
E. J. Beck.
U. S. Patent No. 3,967,449, 8 p, 3 fig, 5 ref; Of cial Gazette of the United States Patent Offi Vol 948, No 1, p 54, July 6, 1976.

Descriptors: *Patents, *Thermal power, *Ocea *Sea water, Hydraulics, Fluid mechani Hydraulic systems, Temperature, Energy, Ener transfer, Thermal powerplants.
Identifiers: *Thermal gradient.

An ocean thermal gradient power plant utilizes concept of converting the potential and/or kine energy developed as a low pressure, high speci volume steam to a hydraulic or kinetic work head in seawater. The plant comprises a hull h ing a pair of air-evacuated, partially submer compartments. Each compartment contains static hydraulic head and is interconnected w the other compartment above the level of the st hydraulic heads. One compartment contains steam-lift pump which, in addition to the st head, creates a hydraulic working head. The wa from the hydraulic working head drives a turb and then exits the compartment to an intermedi depth. Steam from the steam-lift pump is dra into the other compartment where it is conden by a barometric condenser. The water in this co partment exits via a pipe extending from the le of the static hydraulic head to an intermedi depth. A Taylor compressor is located at the fice of the pipe to remove any collected air fr the system. (Sinha-OEIS)

CONNECTING CHANNEL BETWEEN TW DIFFERENT WATER LEVELS,
V. Bauzil.
U. S. Patent No. 3,967,453, 7 p, 10 fig, 8 ref; O cial Gazette of the United States Patent Offi Vol 948, No 1, p 55, July 6, 1976.

Descriptors: *Patents, *Channels, *Water lev *Flow control, *Engineering structures, Stre flow, Check structures, Weirs, Navigation.
Identifiers: Flexible obstacles.

A connecting channel arrangement between levels or water planes of different vertical heigh described so that a permanent continuous comm nication can be assured between these two wa planes. The connecting channel is obstructed p tially by multiple, flexible devices forming an stacle to the free flow of the water in the chan The flexible device assure a significant reduct of the flow and of the speed flow of the wa which would establish itself otherwise within free channel, yet permitting a permanent conn tion between the two levels. The flexibility of devices permits them to deflect out of the way the passage of floating objects such as the di passage of boats or large drifting debris. Th flexible devices are distributed over the en length of the channel to assure a uniform and c tinuous dissipation of the pressure exerted by upstream weir to the entry of the channel. flexible devices can be grouped along transve lines to form a plurality of spaced weirs along length of the channel with a small height ference in water level at each weir. The flex devices are of finger-like shape and extend ve cally and/or horizontally across the bed of channel. (Sinha-OEIS)

THE KARAKAYA DAM AND HYDRO-ELECTRIC PROJECT IN EASTERN TURKEY,
R. J. Andrews.
The Civil Engineer in South Africa, Vol 17 (6), p 151-153, (1975). 5 fig.

Descriptors: Arch dams, *Hydroelectric power plants, *Hydroelectric power, *Multiple purpose projects, Irrigation, Economics.
Identifiers: *Turkey, *Karakaya Dam, *Euphrates River.

The Karakaya Dam and Hydro-electric project on the Euphrates River, which is one of the world's largest multi-purpose development schemes, is described. The installation of 2800-MW of hydroelectric power is previewed, combined with an irrigation scheme which will water 700,000 ha arable lands. The Karakaya Dam and Hydro-electric project (contributing 1800-MW) forms an integral part of this scheme and is located downstream of the 1240-MW Keban Project currently in the final stages of completion. An outline is presented, the river system, the geology, the gravity arch dam and powerplant, the spillway, the outline of structural analysis and the economics of the multipurpose development scheme. FLOODS, A FISSURE AND A PERFECT HOLING.
South African Tunnelling, Suppl. to Construction in S.A. and Coal, Gold and Base Minerals of S.A., Nov. 1975, p 4-15. 1 fig, 1 tab.

Descriptors: *Outfall sewers, *Tunnel design, *Tunnel construction, Floods.
Identifiers: South Africa, Johannesburg.

The main outfall sewer to Klipspruit and to adjacent purification works at Goudkoppies, presently under construction by the Johannesburg City Council, is a completely new outfall designed to augment, and in parts to replace, the existing system. The completed R3,55 million first phase of the project is described. Despite problems caused by flooding and the intersection of a fault fissure, tunnel excavation for the first phase was successfully completed in April 1973 when a near perfect 'holing' of the tunnels was achieved. A project report is given on the first section of the Klipspruit outfall sewer. (South Africa)

Municipal Engineer, Vol 5 (4), p 32-51, (1974). 3 fig, 1 tab.

Descriptors: *Stormwater, *Urban drainage, *Channels, Construction, *Construction costs.
Identifiers: South Africa, *Kerbs.

An informational guide is presented on the functions, types, specifications, methods of construction and construction costs of kerbs and channels used along the edges and central medians of our roads and streets in South Africa. The three basic categories of barrier kerbing, mountable kerbing and flush kerbing are described, together with safety developments such as redirective kerbs,

reflective kerbs, and concrete median barriers. Information is included on kerbside stormwater inlets as an integral part of kerbing and channeling, and on the recent introduction of extruded concrete kerb and channel construction by slipform paver. Based on well-established methods of construction an indication is given of the labour, plant and materials used, the rates of production achieved and construction costs for township streets. MONITORING THE BEHAVIOUR OF ROCK TUNNELS DURING CONSTRUCTION,
Z. T. Bieniawski, and R. K. Maschek.
The Civil Engineer in South Africa, Vol 17(10), p 255-264, (1975). 10 fig, 1 tab, 16 ref.

Descriptors: *Tunnel design, Tunnel construction, *Monitoring, Instrumentation, *Measurement.
Identifiers: South Africa.

Presents practical information for both tunnel designers and constructors on the applications and advantages of in situ measurements of ground displacements during construction of tunnels built in rock. The purpose and meaning of such measurements is outlined and the recommended instrumentation described. Practical information is given for the selection, installation, operation and protection of the monitoring equipment. Results are presented of a one-year long tunnel monitoring program involving sixteen measuring stations in a major railway tunnel. These results are interpreted by taking into account other relevant data recorded during construction, such as rock mass classification, rate of face advance and the amount of support used. The monitoring of tunnel behaviour, by allowing a better assessment of rock mass conditions, tunnel stability and the effectiveness of support measures, results in considerable economic advantages to the owner, better design for the engineer and more efficient construction for the contractor. JOINT SEALING PROBLEMS IN WATER RETAINING STRUCTURES IN JOHANNESBURG,
Johannesburg City Engineer's Dept. (South Africa).
J. E. Kendall, and D. W. Osborn.
The Civil Engineer in South Africa, Vol 17(6), p 135-142, (1975). 11 fig, 3 tab, 5 ref.

Descriptors: Sealants, *Construction joints, Reservoir design, *Reservoir leakage, Reservoir construction, Design criteria, Bacteria, Africa, *Synthetic rubber.
Identifiers: South Africa, Neoprene seal, Polysulphide synthetic rubber, Johannesburg.

The importance of joints in water retaining structures and methods and materials used to seal joints against leakage are described. The failure of jointing at Dunkeld reservoir, its temporary and subsequent permanent repair with a 'bandage' joint seal of polysulphide synthetic rubber compound is fully detailed. The unexpected bacterial attack and degradation of the polysulphide is described and a detailed account of laboratory investigations into the nature of this failure follows. If the long term performance of a Neoprene bandage seal confirms the initial success of this material in Randjeslaagte and Yeoville reservoirs it is suggested that the bandage seal could well eliminate the need for costly waterbars in water retaining structures and attendant construction difficulties. (South Africa)

SEWER LINING,
Council for Scientific and Industrial Research, Pretoria (South Africa).
P. R. Crabtree.
Municipal Engineer, Vol 5 (5), p 13-17, (1974). 9 ref.

Descriptors: *Deterioration, Sewerage, *Linings, *Plastic pipes, *Plastics, Maintenance, Maintenance costs, Monitoring, *Sewers.
Identifiers: South Africa, Television monitoring.

A new technique is described for the renewal of deteriorated sewers namely, a plastic sleeve relining technique whereby high-density polyethylene liners are pulled into existing sewers to restore watertightness and integrity. The process of insert-renewal begins by cleaning and TV inspection of the old sewer. Advantages of and problems with the linings are described. Sewerage engineers are asked to consider the insertion-renewal technique as an alternative to re-excavation, particularly where serious disruption in heavily built-up areas may result from the latter operation. (South Africa)

ntifiers: *Information dissemination, omputer searches, Abstracting services.

e process of information dissemination in the d of water resources has been examined from viewpoint of the user-researcher. It is concluded that no other aspect of water resources earch is more important than information dissination, particularly from researcher to user. examining computer searches retrieved from information base of the Water Resources entific Information Center (WRSIC) system it s ascertained that the WRSIC system is a very ful medium for information transfer; however, s not being used to its full potential largely ause of lack of promotional visibility. The sent status of information dissemination in the er resources field is evaluated and recommenions are made for an expanded system involvstate directors in an integrated system of infortion dissemination. Through reorganization and e reordering of priorities, such a system can be lemented without substantially greater ex-
se.

SUBJECT INDEX

972 FEDERAL WATER POLLUTION CONTROL AMENDMENTS
How Now Brown Cow: Regulation of Feedlot Pollution in Wisconsin,
W77-01549 5G

Mechanical Control of Eurasian Watermilfoil in Maryland With and Without 2,4-D Application,
W77-01289 4A

AL'YAN REGION (USSR)
Rating of Irrigated Soils of the Sal'yan Region, (In Russian),
W77-01208 2G

BSOLUTE LIABILITY
Miller Anti-Pollution Act of 1971 (Absolute Liability of Petroleum Carrier).
W77-01123 6E

BSORPTION
Rating of Irrigated Soils of the Sal'yan Region, (In Russian),
W77-01208 2G

PCB Contents in Marine Animals Collected in the East China Sea, (In Japanese),
W77-01255 5C

The Effect of Arsenic on Embrional Development of Rainbow Trout (Salmo Gairdneri, Rich),
W77-01258 5C

Heavy Metal and Chlorinated Hydrocarbon Residues in California Sea Lions (Zalophus Californianus Californiaus),
W77-01261 5C

The Accumulation of PCB as a Function of Growth in Japanese Anchovy Caught in Osaka Bay, (In Japanese),
W77-01265 5C

Pharmacokinetic Approaches to the Evaluation of Methylmercury in Fish,
W77-01301 5C

Predicting a Bioconcentration Potential of Organic Chemicals in Fish from Partition Coefficients,
W77-01312 5C

BSTRACTS
Coal and the Environment, Abstract Series, Mine Drainage Bibliography, 1910-1976.
W77-01192 5G

Annotated Bibliography of the Lakes, Ponds, and Reservoirs of New York State Through 1974 (Exclusive of Lakes Erie and Ontario),
W77-01418 2H

CARTIA SPP.
Acute Toxicity of Chlorine to Selected Estuarine Species,
W77-01508 5C

CCRETION (LEGAL ASPECTS)
Drawing the Line at the Oceanfront, the Role of Coastal Construction Set-Back Lines in Regulating Development of Florida's Coastal Zone,
W77-01097 6E

CHROMOBACTER
The Bacteriology of Power Station Effluent Used to Farm Marine Fish,
W77-01505 5C

ACIDIC SOILS
Amelioration of Subsurface Acidity by Leaching of Surface Applied Amendments. A Laboratory Study,
W77-01483 2G

ACIDIC WATER
Chronic Effects of Reduced pH on Brook Trout (Salvelinus Fontinalis),
W77-01266 5C

ACIDITY
LCH Fluctuations in Mytilus Edulis L. in Relation to Shell Movements Under Aerobic and Anaerobic Conditions,
W77-01244 5C

Chronic Effects of Reduced pH on Brook Trout (Salvelinus Fontinalis),
W77-01266 5C

ACTIVATED SLUDGE
Dissolved Air (Pressure) Flotation - An Evaluation of Inter-Relationships Between Process Variables and their Optimisation for Design,
W77-01367 5D

Treatment of Sewage with Special Reference to Aeration and Methods of Aeration,
W77-01459 5D

ADAPTATION
Culture Studies on the Effects from Borate Pollution on the Growth of Marine Phytoplankters,
W77-01506 5C

The Effect of the Preliminary Adaptation Temperature on the Distribution of Juvenile Cod (Gadus Morhva) and Pollock (Pollachius Virens) within a Temperature Gradient,
W77-01509 5C

ADDITIVE EFFECTS
The Multiple Toxicity of Certain Heavy Metals: Additive Actions and Interactions,
W77-01303 5C

ADJACENT LAND OWNERS
Cloverleaf Farms, Inc V Surratt (Common Enemy Doctrine: Surface Water).
W77-01113 6E

ADMINISTRATIVE AGENCIES
Commission for Ocean Advancement Through Science and Technology.
W77-01103 6E

Implementation of Multi-Objective Planning in the Department of Commerce,
W77-01159 6B

Florida's System for Regulation of Water Use--A Modern Instrument for Sound Water Resource Management,
W77-01186 6E

ADMINISTRATIVE REGULATIONS
Shoreland Regulation in Wisconsin,
W77-01087 6E

State Ex Rel Brown V Rockside Reclamation (Statute Providing for Granting of Permits Relating to Water Pollution Control--Application).
W77-01114 6E

Country Knolls Water Works, Inc V Reid (Limitation of Output of Private Water Supplier's Well).
W77-01115 6E

ADSORPTION
The Environmental Chemistry of Copper (II) in Aquatic Systems,
W77-01257 5B

Specific Adsorption of Trace Amounts of Calcium and Strontium by Hydrous Oxides of Iron and Aluminum,
W77-01513 2G

AERATION
South African Process Eliminates Dam Pollution.
W77-01377 5D

Full Scale Experimentation on the New Johannesburg Extended Aeration Plants,
W77-01441 5D

Economic Aspects of Wastewater Treatment in South Africa,
W77-01444 5D

Treatment of Sewage with Special Reference to Aeration and Methods of Aeration,
W77-01459 5D

AEROBIC CONDITIONS
Metabolic Adaptations on the Aerobic-anaerobic Transition in the Sea Mussel, Mytilus Edulis L.,
W77-01242 5C

LCH Fluctuations in Mytilus Edulis L. in Relation to Shell Movements Under Aerobic and Anaerobic Conditions,
W77-01244 5C

AESTHETICS
Nonquantitative Methods in Water Resources Management,
W77-01348 6B

AFRICA
Progress in the Exploration and in the Scientific Research of the Libyan Desert Since Gerhard Rohlfs,

CORN (FIELD)
Precipitation of Calcium and Strontium Sulfates Around Plant Roots and Its Evaluation,
W77-01514 2I

CORRELATION ANALYSIS
Stochastic Characteristics of Sediment Motions,
W77-01140 2J

COST ANALYSIS
An Exploratory Study of Possible Energy Savings as a Result of Water Conservation Practices,
W77-01052 3E

The Cost-Effectiveness Approach in Analyzing a Water Supply Project for the Santa Elena Peninsula, Ecuador,
W77-01270 6B

Clearing an Alligator Juniper Watershed with Saws and Chemicals: A Cost Analysis,
W77-01430 4D

COST-BENEFIT ANALYSIS
Caught in Mid-Stream: Army Corps of Engineers,
W77-01086 6E

COST-EFFECTIVENESS ANALYSIS
The Cost-Effectiveness Approach in Analyzing a Water Supply Project for the Santa Elena Peninsula, Ecuador,
W77-01270 6B

COST MINIMIZATION
A Solution Procedure for the Design Problem of a Multiple Treatment Plant System Along A Stream,
W77-01165 5D

Pumping Policies in Water Supply,
W77-01177 4A

COSTS
Energy for Water,
W77-01273 6D

CRABS
Temperature Variation in Fiddler Crab Microhabitats,
W77-01058 5C

Shell Disease in Crabs and Lobsters from New York Bight,
W77-01500 5C

CRASSOSTREA VIRGINICA
The Effects of Thermal Effluent on the American Oyster, Crassostrea Virginica Gmelin in Indian River Bay, Delaware,
W77-01237 5C

CROCODILE RIVER
Damming the Crocodile.
W77-01472 6D

CROP RESPONSE
A Note on the Use of Bentonite Clay as a Sub-Soil Moisture Barrier for Vegetable Production on Drylands of Rajasthan,
W77-01277 3F

Response of Wheat Under Sub-Humid Irrigated Conditions to Atmospheric Misting During Grain Filling,
W77-01284 3F

Dairy Manure Utilization and Field Application Rates,
W77-01532 5B

Disposal of Beef Feedlot Manure,
W77-01536 5E

CRUDE OIL
Acute Toxicities of Crude Oils and Oil-Dispersant Mixtures to Red Sea Fishes and Invertebrates,
W77-01256 5C

Some Effects of Kuwait Crude Oil on the Limpet, Patella Vulgata,
W77-01275 5C

CRUSTACEANS
Acute Toxicities of Crude Oils and Oil-Dispersant Mixtures to Red Sea Fishes and Invertebrates,
W77-01256 5C

Incidence of Shell Disease in Shrimp in the New York Bight,
W77-01502 5C

CULEX-PIPIENS
A Comparison of Oil and Flit MLO for Catch Basin Treatment,
W77-01357 5G

CULTIVATION
The Impact of Increased Energy Costs on Water Use and Agricultural Output in Northwestern Oklahoma,
W77-01056 3F

CULTURAL CONTROL
Effect of Some Pesticides on the Ability of the Filteration of Eel Culture Using Recirculating Filter System, (In Korean),
W77-01497 5C

CUPRIC ION
Toxicity Relationships to Copper Forms in Natural Waters,
W77-01304 5C

CURRENTS (WATER)
Dynamically Balanced Apparatus for Water Borne Instruments,
W77-01232 7B

CYANIDE
Compilation of State Data for Eight Selected Toxic Substances, Vol. III, Annotated Bibliography of State Data and Information Sources,
W77-01494 5A

CYANIDE COMPLEXES
Mathematical Analysis of the Chemical System 'Cyanide-Heavy Metals' in the Water-Determination of Components and Toxicity of the System-I, the Theoretical Solution,
W77-01259 5B

CYANIDE-HEAVY METAL COMPLEXES
Mathematical Analysis of the Chemical System 'Cyanide-Heavy Metals' in Water-Determination of Components and Toxicity of the System-II, Solution by Computer,
W77-01260 5B

CYANIDE-HEAVY METALS
Mathematical Analysis of the Chemical System 'Cyanide-Heavy Metals' in the Water-Determination of Components and Toxicity of the System-I, the Theoretical Solution,
W77-01259 5B

CYANIDES
Process for Detoxification of Cyanides and Nitriles with Peroxygen Compounds,
W77-01227 5D

CYCLING NUTRIENTS
Nutrient Recycling and the Stability of Ecosystems: Implications for Forest Management in the Southeastern U.S.,
W77-01420 2K

CYCLOPS SPP
Toxicity of 30-Minute Exposures of Residual Chlorine to the Copepods Limnocalanus Macrurus and Cyclops Bicuspidatus Thomasi,
W77-01507 5C

DAIRY INDUSTRY
Manure Disposal, Pollution Control, and the New York Dairy Farmer,
W77-01528 5D

DAIRY MANURE
Dairy Manure Utilization and Field Application Rates,
W77-01532 5B

DAM CONSTRUCTION
Caught in Mid-Stream: Army Corps of Engineers,
W77-01086 6E

R26m Dam Plan for the Lowveld.
W77-01478 8A

DAM DESIGN
South Africa's Own Snowy Mountain Scheme,
W77-01374 8C

Change in Big Dam Plan.
W77-01476 8

DAM FAILURE
Teton Dam Flood of June 1976, Morelan Quadrangle, Idaho,
W77-01395 7

Teton Dam Flood of June 1976, Firth Quadrangle, Idaho,
W77-01396 7

Teton Dam Flood of June 1976, Rose Quadrangle, Idaho,
W77-01397 7

Teton Dam Flood of June 1976, Menan Butt Quadrangle, Idaho,
W77-01398 7

Teton Dam Flood of June 1976, Newdale Quadrangle, Idaho,
W77-01399 7

Teton Dam Flood of June 1976, Park Quadrangle, Idaho,
W77-01400 7

Teton Dam Flood of June 1976, Blackfoot Quadrangle, Idaho,
W77-01401 7

Teton Dam Flood of June 1976, Pingree Quadrangle, Idaho,
W77-01402 7

Teton Dam Flood of June 1976, Moore Quadrangle, Idaho,
W77-01403 7

Teton Dam Flood of June 1976, Rexburg Quadrangle, Idaho,
W77-01404 7

Teton Dam Flood of June 1976, Rigby Quadrangle, Idaho,
W77-01405 7

Teton Dam Flood of June 1976, Lewisville Quadrangle, Idaho,
W77-01406 7

Teton Dam Flood of June 1976, Woodville Quadrangle, Idaho,
W77-01407 7

Teton Dam Flood of June 1976, St. Anthony Quadrangle, Idaho,
W77-01408 7

Teton Dam Flood of June 1976, Deer Park Quadrangle, Idaho,
W77-01409 7

Teton Dam Flood of June 1976, Idaho Falls South Quadrangle, Idaho,
W77-01410 7

Teton Dam Flood of June 1976, Idaho Falls North Quadrangle, Idaho,
W77-01411 7

DAMS
Cloverleaf Farms, Inc V Surratt (Commonwealth Enemy Doctrine: Surface Water).
W77-01113 6E

Water Power Companies--Eminent Domain,
W77-01117 6E

DANUBE RIVER (W. GERMANY)
Developing Optimal Operating Rules for Flood Protection Reservoirs,
W77-01174 4A

A COLLECTIONS
lluter Discriminant Analysis,
77-01166 5G

ower Green Bay. An Evaluation of Existing d Historical Conditions,
77-01287 5C

atistical Properties of Environmental Data: onsiderations for Bioaccumulation and Tox- ty Studies of Pollutants,
77-01316 5C

A COMPRESSION
ompression of Time-Series Data,
77-01132 7C

A MANAGEMENT
avironmental Data Management,
77-01347 6G

A PROCESSING
ompression of Time-Series Data,
77-01132 7C

Simple Computer Program for the Deter- ination of Aquifer Characteristics from Pump est Data,
77-01337 7C

avironmental Data Management,
77-01347 6G

A STORAGE AND RETRIEVAL
ompression of Time-Series Data,
77-01132 7C

CISION-MAKING
egal Problems Associated with the Role of anning in Water Resources Management,
77-01185 6E

ultiobjective Planning: Concepts and ethods,
77-01346 6B

EP SEA CHANNEL
ubmarine Meandering Thalweg and Turbidity urrent Flowing for 4,000 KM in the orthwest Atlantic Mid-Ocean Channel, abrador Sea,
77-01150 2L

EP-WELL PUMPING
he Impact of Increased Energy Costs on Vater Use and Agricultural Output in orthwestern Oklahoma,
77-01056 3F

FICIENT ELEMENTS
lineral Requirements in Fish--II. Magnesium equirement of Carp,
77-01239 5C

ICERS
alt Storage and Runoff in Urban Watershed,
77-01336 5B

LAWARE
he Effects of Thermal Effluent on the Amer- an Oyster, Crassostrea Virginica Gmelin in ndian River Bay, Delaware,
77-01237 5C

MINERALIZATION
rocess for Extracting Dissolved Salts from Vater,
77-01198 3A

lethod for Preventing Scale in Saline Water esalting Apparatus and Saline Water Recla- ation Apparatus for Carrying out said lethod,
77-01215 3A

DENITRIFICATION
Soil Nitrate Loss During Irrigation: Enhance- ment by Plant Roots,
W77-01268 3F

DEPTH-AREA-DURATION ANALYSIS
Generalized Relationship Between Maximum Rain Depth, Area and Return Period for Major Rainstorms,
W77-01131 2B

DESALINATION
Water Law and New Technologies.
W77-01184 6E

Process for Extracting Dissolved Salts from Water,
W77-01198 3A

Multi-Stage Flash Distillation Plant,
W77-01199 3A

Method for Preventing Scale in Saline Water Desalting Apparatus and Saline Water Reclamation Apparatus for Carrying out said Method,
W77-01215 3A

The Removal of Salt and Organic Material from Sewage Effluent by Anion Exchange Resins,
W77-01364 5D

DESCALING
Method for Preventing Scale in Saline Water Desalting Apparatus and Saline Water Reclamation Apparatus for Carrying out said Method,
W77-01215 3A

DESERTS
Progress in the Exploration and in the Scientific Research of the Libyan Desert Since Gerhard Rohlfs,
W77-01269 4A

Settlements in the Rajasthan Canal Irrigation Area, India,
W77-01272 4C

DESIGN
A Solution Procedure for the Design Problem of a Multiple Treatment Plant System Along A Stream,
W77-01165 5D

DESIGN CRITERIA
A Sanitary Engineer's Viewpoint on the Design, Installation, Maintenance and Cost of Sanitary Drainage Systems in High-Rise Buildings,
W77-01388 8A

R26m Dam Plan for the Lowveld.
W77-01478 8A

DESIGN DATA
Sugarloaf Creek Project (Australia): Flood Studies.
W77-01067 8A

DESIGN FLOOD
A Revised Regional Frequency Curve for the Yarra Catchment Above Warrandyte (Australia).
W77-01068 4A

Design Flood Synthesis by Excess Rain Routing,
W77-01452 2A

DESIGN STANDARDS
The National Flood Insurance Act of 1968 and Flood Plain Zoning in Arkansas, Nebraska, North Dakota, Mississippi, Tennessee, South Dakota, and Kansas,
W77-01099 6E

DESIGN STORM
A Study of Maximum Values of Within-Storm Rainfall,
W77-01127 2B

DESTRATIFICATION
Water Salvage Potentials in Utah, Volume II, Evaporation Suppression by Reservoir Destratification,
W77-01164 2D

DETERIORATION
Sewer Lining,
W77-01491 8G

DEVELOPING COUNTRIES
Federal Manpower in Water Resource Engineering,
W77-01342 6B

DIELDRIN
Application of 24-Hour Postexposure Observation to Acute Toxicity Studies with Invertebrates,
W77-01252 5C

DIFFUSION
Numerical Computation of Well-Mixed Estuarine Flows,
W77-01139 2L

DISCHARGE MEASUREMENT
Discharge Characteristics of Spaced Slits in Polyethelene Pipes Under Pulsating Pressure Conditions,
W77-01443 3F

DISCRIMINANT ANALYSIS
Polluter Discriminant Analysis,
W77-01166 5G

DISEASE VECTORS
Wildlife and Oil Shale, A Problem Analysis and Research Program. Volume II, Appendix.
W77-01236 5C

DISEASES
Shell Disease in Crabs and Lobsters from New York Bight,
W77-01500 5C

DISPERSION
Oil-Spill Dispersant for Marine Pollution (Lekoliedispergeermiddel vir seebesoedeling).
W77-01387 5G

DISSOLVED OXYGEN
The Benthos of Some Southern African Lakes Part 3: The Benthic Fauna of Lake Nhlange, Kwazulu, South Africa,
W77-01437 2H

DISSOLVED TRANSPORT
Total Mineral Dissolved Transport by World Major Rivers,
W77-01135 5B

DISTRIBUTION
Temperature and the Vertical Distribution of Two Tidepool Fishes (Oligocottus Maculosus, O. Snyderi),
W77-01060 5C

Distribution and Significance of Fecal Indicator Organisms in the Upper Chesapeake Bay,
W77-01061 5C

Distribution and Bioaccumulation of Mercury in Biotic and Abiotic Compartments of a Contaminated River-Reservoir System,
W77-01297 5C

Pharmacokinetic Approaches to the Evaluation of Methylmercury in Fish,
W77-01301 5C

Some Aquatic Vertebrates from the Namib Desert, South West Africa,
W77-01493 2I

The Effect of the Preliminary Adaptation Temperature on the Distribution of Juvenile Cod (Gadus Morhva) and Pollock (Pollachius Virens) within a Temperature Gradient,
W77-01509 5C

DISTRIBUTION PATTERNS
Seasonal Distributions of Larval Flatfishes (Pleuronectiformes) on the Continental Shelf Between Cape Cod, Massachusetts, and Cape Lookout, North Carolina, 1965-66,
W77-01064 2L

A Study of Hourly Rainfall Distribution Around Monsoon Depression Centre in Central India,
W77-01125 2B

DITCHES
Mining and Manufacturing Corporations.
W77-01118 6E

DIURNAL
Diurnal Variation of Rainfall in Brahmaputra Valley,
W77-01126 2B

Daily Pattern of Nitrogen Excretion and Oxygen Consumption of Sockeye Salmon (Oncorhynchus Nerka) under Controlled Conditions,
W77-01250 5C

DIVERSION STRUCTURES
83 Kilometres of Risks and Unknowns.
W77-01469 8H

DIVERSITY (PHYTOPLANKTON)
Phytoplankton Diversity AHD Chlorophyll-a in a Polluted Estuary,
W77-01499 5C

DOMESTIC WASTES
Urban Solid Wastes Engineering,
W77-01379 5E

DOMESTIC WATER
The Effects of Pressure on Domestic Water Supply Including Observations on the Effect of Limited Garden-Watering Restrictions During a Period of High Demand,
W77-01360 3D

DRAINAGE
Unsteady Flow of Water through Soils Drained by Parallel Ditches, (In French),
W77-01219 2G

DRAINAGE SYSTEMS
A Sanitary Engineer's Viewpoint on the Design, Installation, Maintenance and Cost of Sanitary Drainage Systems in High-Rise Buildings,
W77-01388 8A

Application of Municipal By-Laws with Special Reference to Drainage Regulations,
W77-01485 4A

DREDGING
Coastal Construction and Other Physical Activities Seaward of the Mean High Water Line,
W77-01102 6E

DRIP IRRIGATION
Drip Irrigation: Israel Teaches California,
W77-01080 3F

Drip Irrigation Device,
W77-01213 3F

Discharge Characteristics of Spaced Slits in Polyethelene Pipes Under Pulsating Pressure Conditions,
W77-01443 3F

DROP BOX INLETS
Comparison of Chute and Stilling Basin Performance for Three Different Drop Box Inlets,
W77-01151 8B

DROUGHT RESISTANCE
Leaf Diffusion Resistance to Water Vapour and its Direct Measurement,
W77-01378 2D

DROUGHTS
Dynamical Abnormalities Associated with Drought in the Asiatic Summer Monsoon,
W77-01128 2B

The Study of Droughts by Water Budget Method over Andhra Pradesh,
W77-01130 2B

DRY COOLING
Escom Pioneers Dry Cooling,
W77-01467 3E

The Cooling Water Equation,
W77-01468 6D

DRYING
Influence of Hysteresis on Moisture Flow in an Undisturbed Soil Monolith,
W77-01323 2G

DYES
A Laboratory Evaluation of a Dye for the Control of Alagal Growth,
W77-01355 5G

DYNAMIC PROGRAMMING
Developing Optimal Operating Rules for Flood Protection Reservoirs,
W77-01174 4A

EAST CHINA SEA
PCB Contents in Marine Animals Collected in the East China Sea, (In Japanese),
W77-01255 5C

ECOLOGICAL STANDARDS
Research to Develop Ecological Standards for Water Resources,
W77-01054 6G

ECONOMIC EFFICIENCY
The Cost-Effectiveness Approach in Analyzing a Water Supply Project for the Santa Elena Peninsula, Ecuador,
W77-01270 6B

ECONOMIC RESEARCH SERVICE (U.S. DEPT. OF AGRICULTURE)
Perspective and Role of the Economic Research Service in Multiple Objective Planning,
W77-01162 6B

ECONOMICS
A Coarse Sort System for Preliminary Wa Resources Management Alternatives,
W77-01055

The Impact of Increased Energy Costs Water Use and Agricultural Output Northwestern Oklahoma,
W77-01056

Economic Aspects of Wastewater Treatment South Africa,
W77-01444

'Approaches to Multi-Objective Planning Water Resource Projects,' by Bernard Taylor III, K. Roscoe Davis, and Ronald North,
W77-01510

Implications of EPA Proposed Regulations November 20, 1975 for the Animal Feeding dustries,
W77-01529

ECOSYSTEMS
A Technique for Predicting the Aqua Ecosystem Response to Weather Modificatio
W77-01051

Research to Develop Ecological Standards Water Resources,
W77-01054

Modeling Phytoplankton Blooms in a Stratif Embayment,
W77-01163

Ecosystem Models and Environmental Policy
W77-01172

Wildlife and Oil Shale, A Problem Analysis a Research Program. Volume II, Appendix.
W77-01236

Nutrient Recycling and the Stability Ecosystems: Implications for Forest Mana ment in the Southeastern U.S.,
W77-01420

EDDIES
Geometry of River Meanders,
W77-01340

EDUCATION
Education and Traning in Water Resour Planning,
W77-01344

EDWARDS AQUIFER (TEX)
Statistical Analysis of Water-Level Springflo and Streamflow Data for the Edwards Aqui in South-Central Texas,
W77-01417

EERSTE RIVER
A Hydro-Economic Evaluation of Forestry the Eerste River Catchment,
W77-01368

Allocation of Water to Forestry and Ot Users in the Catchment of the Eerste River,
W77-01385

EFFLUENTS
Better Than Best: A Crosscurrent in Federal Water Pollution Control Act Amen ments of 1972,
W77-01073

;
Draft Environmental Statement: Project Skywater A Program of Research in Precipitation Management, Volume I of II.
W77-01187 6G

ECTRIC POWER
The Cooling Water Equation,
W77-01468 6D

ECTRICAL POWER PRODUCTION
Power and Water for South West Africa,
W77-01382 3E

ECTRODES
Waste Water Treatment,
W77-01217 5D

ECTROSTATIC
Theoretical Model for the Formation of Ion-Pairs in Seawater,
W77-01341 2K

EMBRYONIC GROWTH STAGE
The Effect of Arsenic on Embrional Development of Rainbow Trout (Salmo Gairdneri, Rich),
W77-01258 5C

Chronic Effects of Reduced pH on Brook Trout (Salvelinus Fontinalis),
W77-01266 5C

EMINENT DOMAIN
Water Power Companies--Eminent Domain,
W77-01117 6E

ENDOTHAL
Application of 24-Hour Postexposure Observation to Acute Toxicity Studies with Invertebrates,
W77-01252 5C

ENDRIN
Toxicity of Endrin and an Endrin-Methyl Parathion Formulation to Largemouth Bass Fingerlings,
W77-01066 5C

ENERGY
An Exploratory Study of Possible Energy Savings as a Result of Water Conservation Practices,
W77-01052 3E

Wave Energy Machine,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

- 1 NATURE OF WATER
- 2 WATER CYCLE
- 3 WATER SUPPLY AUGMENTATION AND CONSERVATION
- 4 WATER QUANTITY MANAGEMENT AND CONTROL
- 5 WATER QUALITY MANAGEMENT AND PROTECTION
- 6 WATER RESOURCES PLANNING
- 7 RESOURCES DATA
- 8 ENGINEERING WORKS
- 9 MANPOWER, GRANTS, AND FACILITIES

SELECTED WATER RESOURCES ABSTRACTS

The Library of the

at Urbana-Champaign

VOLUME 10, NUMBER 4
FEBRUARY 15, 1977

W77-01551 -- W77-02075
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 10, NUMBER 4
FEBRUARY 15, 1977

W77-01551 -- W77-02075

he Secretary of the U.S. Department of the Interior has determined that the publication of this periodical is necessary in the ansaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1B. Aqueous Solutions and Suspensions

SOME ASPECTS OF NUCLEAR SPIN RELAXATION OF ADSORBED WATER PROTONS IN BIOLOGICAL MATRICES, (IN RUSSIAN),
Institut Fiziki, Krasnoyarsk (USSR).
For primary bibliographic entry see Field 5A.
W77-01563

SOME ASPECTS OF NUCLEAR SPIN RELAXATION OF WATER ADSORBATE PROTONS IN BIOLOGICAL MATRICES, (IN RUSSIAN),
Institut Fiziki, Krasnoyarsk (USSR).
For primary bibliographic entry see Field 5A.
W77-01564

2. WATER CYCLE

2A. General

A MODEL STUDY OF THE EFFECTS OF ARTIFICIAL RECHARGE,
Department of the Environment, Reading (England). Central Water Planning Unit.
For primary bibliographic entry see Field 4B.
W77-01883

TWENTY-SIX-YEAR CYCLICAL DISTRIBUTION OF DROUGHT AND FLOOD IN CEARA, BRAZIL,
California State Univ., Fresno.
For primary bibliographic entry see Field 2B.
W77-01897

HYDROLOGICAL AND HYDRAULICAL CONCEPTUAL MODELS APPLICABLE TO OVERLAND AND RIVER TRANSPORT MODELING,
Marquette Univ., Milwaukee, Wis. Dept. of Civil Engineering.
V. Novotny.
Wisconsin Univ., Madison, Water Resources Center, Literature Review No. 4, August 1976. 61 p. 14 fig., 13 tab., 72 ref. EPA R00514201.

Descriptors: *Hydrologic models, *Mathematical models, *River flow, *Runoff, *Methodology, Overland flow, Infiltration, Soil texture, Hydraulic conductivity, Equations, Penetration, Groundwater movement, Soil-water movement, Interception, Rainfall-runoff relationships, Depression storage, Evaporation, Evapotranspiration, Melt water, Channel flow, *Reviews, Watersheds(Basins).
Identifiers: *Literature reviews.
